INTRODUCTION

The Air Force Office of Scientific Research Technical Report Summaries are published quarterly as of March, June, September, and December of each calendar year. They consist of a brief summary of each AFOSR technical report received in the Technical Information Division and submitted to the Defense Technical Information Center (DTIC) for that quarter. The summaries contain two indexes for easily locating the technical reports that may be of interest to the user. These are followed by abstracts of the reports.

1) SUBJECT INDEX

- a. Subject Field
- b. Title of Report
- c. AD Number (Accession Number)

2) PERSONAL AUTHOR INDEX

- a. Primary Author
- b. Title of Report
- c. AD Number

AFOSR does not maintain copies of technical reports for distribution. However, you may obtain any of these reports if you are a registered government agency or government contractor with DTIC, by requesting the AD number of that report from the DTIC, Cameron Station, Alexandria, Virginia, 22314.

PURPOSE

The purpose of this report is to inform Air Force Laboratories about the science that the Air Force Office of Scientific Research is supporting.

4-1

AFOSR MISSION

The Air Force Office of Scientific Research (AFOSR) is the Single Manager of the Air Force Defense Research Sciences Program (Program Element 61102F) and the primary Air Force agency for the extramural support of fundamental scientific research. The AFOSR is organizationally under the DCS/Science and Technology, Air Force Systems Command.

AFOSR awards grants and contracts for research in areas of science relevant to the needs of the Air Force. Research is selected for support from unsolicited proposals originating from scientists investigating problems involving the search for new knowledge and the expansion of scientific principles. Selection is on the basis of scientific potential for improving Air Force operational capabilities, originality, significance to science, the qualification of the principal investigators, and the reasonableness of the proposed budget.

KEY TO READING THE DATA

The summaries consist of two indexes and the abstracts. From one of the two indexes, locate the AD number of the report that is of interest to you. Use this number to locate the abstract of the report in the abstracts section. The first report submitted to DTIC during the quarter (the one with the lowest AD number) appears on the last page of the abstracts section. The last report submitted to DTIC during the quarter (the one with the highest DTIC number) appears on the first page of the abstracts section. The following terms will give you a brief description of the elements used in each summary of this report.

DTIC Report Bibliography - DTIC's brief description of a technical report.

Search Control Number - A number assigned by DTIC at the time a bibliography is printed.

AD Number - A number assigned to each technical report when received by the DTIC.

Field & Group Numbers - (appearing after the AD number) First number is the subject field and the second number after the slash is the particular group under that subject field.

Corporate Author/Performing Organization - The organization; e.g., college/university, company, etc., at which the research is conducted.

Title - The title of the technical report.

Descriptive Note - Gives the type of report; e.g., final, interim, etc., and the period of the time of the research.

Date - Date of the technical report.

Pages - Total number of pages contained in the technical report.

Personal Author - Person or persons who wrote the report.

Contract/Grant Number - The instrument control number identifying the contracting activity and funding year under which the research is initiated.

Project Number - A number unique to a particular area of science; e.g., 2304 is the project number for mathematics.

Task Number - An alphanumeric number unique to a specific field of the main area of science; e.g., 2304 is the project number for mathematics and A3 is the task number for computational sciences.

Monitor Number - The number assigned to a particular report by the government agency monitoring the research. The number consists of the government monitor acronym, the present calendar year and the technical report assigned consecutively; e.g., AFOSR-TR-83-0001 is the first number used for the first technical report processed for Calendar Year 1983.

Supplementary Note - A variety of statements pertaining to a report. For example, if the report is a journal article, the supplementary note might give you the journal citation, which will include the name of the journal the article it appears in, and the volume number, date, and the page numbers of the journal.

Abstract - A brief summary describing the research of the report.

Descriptors - Key words describing the research.

Identifiers - Commonly used designators, such as names of equipment, names of projects or acronyms, the AFOSR project and task number, and the Air Force Research Program Element number.

Interim Technical Report, Grant AFOSR-82-0135, 15 March 1983 to 14 March 1984.*
AD-A142 229
Interim Scientific Report, Grant AFOSR-81-0103, 1 May 83 to 30 April 84.*
AD-A142 634

Reprint: The Inverse Scattering Problem for Time-Harmonic Acoustic Waves.
AD-A144 368

*IODINE

Photoionization Investigation of Iodine Molecules and Clusters in a Supersonic Molecular Beam.*
AD-A142 645

*ION BEAMS

Investigation of Ion Beam Production and Acceleration Using Linear Electron Beams and a Pulse

Powered Plasma Focus.*
AD-A144 525

*IONOSPHERE

High-Latitude Ionospheric Irregularities.*
AD-A142 648

*IONOSPHERIC MODIFICATION

Reprint: Multistation Measurements of High-Latitude Ionospheric Convection.
AD-A142 285

*IONOSPHERIC SCINTILLATIONS

High-Latitude Ionospheric Irregularities.*
AD-A142 648

*IONS

Reprint: Theoretical Studies of Polyvinyl-Substituted Carbenium and Silylenium Ions.
AD-A141 619
Reprint: Vibrational Energy Disposal in Polyatomic Ion-Molecule Reactions: SF₆(-) H₂O Yields SF₅(-) HF(V), DF(V).
AD-A141 638

Reprint: Flowing Afterglow Studies of Ion Reaction Dynamics Using Infrared Chemiluminescence and Laser-Induced Fluorescence.
AD-A144 506

*ISOMERIZATION

Reprint: Second Order Rate Constraints for Intramolecular Conversions: Application to Gas-Phase NMR Relaxation Times.
AD-A141 615

*ISOMERS

Reprint: Perfluorotropilidene Valence Isomers and the Perfluorotropylium Ion.
AD-A145 099

*ISOSTATIC PRESSING

Hot Isostatic Pressing of Ceramic Powder Compacts.*

AD-A144 123

*ITERATIONS

Reprint: Reconstruction and Synthesis Applications of an Iterative Algorithm.
AD-A141 604

An Iterative Method for Restoring Noisy Blurred Images.*

AD-A142 201
Reprint: Ignorance Based Systems.
AD-A142 581

A Study of Some Multi-Grid Ideas.*

AD-A144 465
Iterative Methods for Elliptic Problems and the Discovery of 'q'.*
AD-A144 483
Annual Report, Air Force Grant AFOSR-82-0275.*
AD-A145 239

*JET FLOW

Control of Jet Flowfield Dynamics.*
AD-A143 631

*JUNCTIONS

Reprint: A 15 Nb-Sn Tunnel Junction Fabrication and Properties.
AD-A144 248

*KALMAN FILTERING

Sensor Noise and Kalman Filter for Aided Inertial Navigation System.*
AD-A143 360

*LABORATORIES

United States Air Force Geophysics Scholar Program, 1982-1983.*

ABSTRACT: (U) The Amchitka nuclear tests MILROW and CANNIKIN were well recorded in the near field. Three component velocity records are available both from within the spall zone and from the near field elastic region. In previous work, the records from the elastic region were modeled using a point source and an elastic medium. In this work, the predictions of the elastic model are compared to the observed initial peak velocity from within the spall zone. The purpose was to attempt to observe the effects of nonlinear absorption by the medium due to the high strains and strain rates. The elastic model predicted the observations closely, indicating that the nonlinear effects are small while the material is under compression. Of course, when the medium is placed under tension by the free surface reflection, spallation occurs and nonlinear effects become very important. The effects of radiation by spall into the elastic region are also considered. Two finite source representations for the spall source are presented; these are a cone of shear dislocations and a disk of tension cracks. The spall event is shown to be the possible cause of a small arrival in the teleseismic P wavetrain and also the cause

UNCLASSIFIED REPORT

ABSTRACT: (U) Continuing its expansive growth, nearly 800 participants attended the 5th IEEE Pulsed Power Conference with 38 individuals from nine foreign countries - Canada, England, France, Israel, Japan, West Germany, Italy, Switzerland, and Denmark. The number of technical contributions was 220 resulting, for the first time, in a conference with four parallel sessions. In addition to the many fine comments on the technical content of the meeting, we received ample praise for the accommodations, special events and general excellence of the facilities at the Albuquerque Convention Center. It is with reluctance that we leave these facilities for the 1983 conference. The Executive Committee voted to hold the 5th IEEE Pulsed Power Conference in the Washington, D. C. area on June 10, 11, and 12, 1985. Frank Rose of the Naval Surface Weapons Center was elected as Conference Chairman with Peter Turchi, R and D Associates, as the Technical Program Committee Chairman.

UNCLASSIFIED REPORT

ABSTRACT: (U) The development of solution algorithms for complex flowfields is the continuing objective of the research. Major focus is on use of coupled subdomains and descriptions which are either preselected or adapted to fit the physical events when necessary. The non-adaptive embedded mesh algorithm has completed airfoil solutions with an allowance for highly stretched meshes, alternate grids and reducing smoothing. A new algorithm is combining features from cell and nodal-centered methods to permit general embedded topology. Adaptive embedded mesh procedures have been extended to and carried out for two-dimensional Euler, subsonic, transonic and supersonic flows. An optimal distribution of local Courant numbers has been considered as a basis for accelerating the solution approach to a steady state. (Author)

ABSTRACT: (U) The order release problem involves selecting subsets of available orders to release to the shop floor such that the system is utilized efficiently and queue time is reduced. A solution to this problem is proposed which combines Leontief flow models and linear programming in an iterative procedure. Examples of the approach are illustrated. (Author)

UNCLASSIFIED REPORT

SUPPLEMENTARY NOTE: Prepared in cooperation with Southeastern Center for Electrical Engineering Education, St. Cloud, FL, Contract F49620-82-C-0035.

ABSTRACT: (U) An important element of piloting high-performance jet aircraft is the human ability to perform spatial orientation information processing, particularly when it involves the use of video display instrumentation. Spatial disorientation has consistently been the cause of numerous accidents throughout the history of flight. A study was conducted to further evaluate the Manikin Task, a complex reaction time task previously developed by the RAF as a test of spatial orientation. The objectives of the study were to (1) thoroughly evaluate the training characteristics of the task including variation in performance related to individual stimuli characteristics, (2) determine the task's speed vs. accuracy tradeoff characteristics, and (3) assess performance on the task under the influence of ethyl alcohol. Response times and accuracy were measured on five subjects under various conditions over a five-week period. Analysis of the data indicated a substantial dependence of response times on certain stimuli characteristics. In addition, there was a definite decline in accuracy corresponding to a forced decrease in response time. However, the relationship could not be adequately represented by the proposed speed-

AD-A145 211

AD-A145 211

UNCLASSIFIED

accuracy tradeoff functions. The effect of alcohol was evidenced primarily by a change in the slope of the speed-accuracy tradeoff relationship.

ABSTRACT: (U) The solubility of toluene, benzene, 1,1,2, trichloroethylene and p-cresol singly in high purity water at 20 degrees C was determined under dynamic and static conditions. Toluene present in an aqueous solution enhanced the benzene solubility, decreased the time for solubility to be attained and increased the rate at which solubility was attained. Toluene present in the water caused little difference in the time for 1,1,2 trichloroethylene to reach solubility equilibrium, but caused a more rapid rate in attaining solubility equilibrium and increased the solubility equilibrium concentration. The effect of toluene on the solubility kinetics of p-cresol was to reduce the time in attaining solubility equilibrium, increase the rate in achieving solubility equilibrium and caused little change in the solubility concentration. UNCLASSIFIED REPORT

ABSTRACT: (U) A general analysis of periodic three-dimensional vortical disturbances of streaming motions around streamlined and bluff bodies is developed using a unified approach wherein the mathematical problem is reduced to solving a single inhomogeneous wave equation with non-constant coefficients. In the limit of vanishing Mach number, the problem is formulated in terms of an inhomogeneous Fredholm integral equation of the second kind. The analysis is first applied to study the unsteady aerodynamics of an airfoil of arbitrary shape moving at low Mach number in a three-dimensional periodic gust pattern. Because the homogeneous equation has a non-trivial solution, a special procedure was developed for its solution and uniqueness is obtained by applying the Kutta condition at the trailing edge. Results were compared with those obtained from a nonlinear two dimensional gust theory and linear oblique gust analyses. Comparison shows a very strong influence of the airfoil geometry and mean flow angle of attack and of the gust parameters on the unsteady lift and moment coefficients. In fact, depending on the conditions considered, the unsteady lift and moment coefficients can be several times larger or smaller than those obtained from linear theories. A superposition principle was derived whereby the unsteady lift and moment acting on a thin airfoil

with small camber and small angle of attack and subject to a two-dimensional gust can be constructed by linear superposition to the Sears lift and moment of three independent components accounting separately for the effects of airfoil thickness, airfoil camber and non-zero angle of attack of the mean flow.

ABSTRACT: (U) Further support of the LANL experiment and the strong-field synchrotron instability has used the periodic window for optical mode analysis. Using the LANL parameters current and magnetic field strength, the effect of the resonator or mode stability was examined. It was found that as much as 20% loss/pass was necessary for the FEL to run without sidebands. When the losses were dropped to 14% pass, a single sideband appeared in the untapered FEL planned at LANL. When the losses were lowered to 1% (as eventually planned), the optical field vacame chaotic and the FEL went broad band. (Author)

ABSTRACT: (U) This paper highlights three areas which are of importance in computer science, and in which statisticians can make valuable contributions. The authors outline these areas, survey the developments, and point out some of the open problems. The research areas are: software reliability, the reliability of fault tolerant computers, and the reliability of computer networks.

ABSTRACT: (U) During this research period progress was made on the system integration of the software tasker to support algorithmic and applications segmentation for concurrent computing. This permits an efficient distribution of code and data on processing elements. The tasker provides primitives to support the segmenting of processes, monitors execution on worker processors by the manager on each concurrent system, and achieves asynchronous communication among worker processors and between the manager processor and the workers. ABSTRACT: (U) This paper examines the problem of positivity in relation to the partial realization of scalar power series. An exact criterion of positivity is proved for second-order realizations. The general case is currently unsolved. Even the special results contained here show that the so-called maximum entropy principle cannot be applied to the realization problem in the naive sense in which it is employed by physicists. It would be better to call this principle a prejudice because it does not fully utilize the information inherent in the data and does not provide a realization with natural (minimal) mathematical properties. ABSTRACT: (U) The objective of this research was to develop an advanced, nonlinear, multiaxial constitutive theory for reinforced concrete which provides a modeling capability that is superior to existing models, especially in the nonlinear response regime. The problem of constructing such a theory is partitioned into two major tasks, which have been pursued concurrently. One task consists of formulating a procedure (mixture theory) for analytically mixing reinforcing steel and plain concrete, so that the interaction between the two, which plays a key role in the overall behavior of reinforced concrete, is properly modeled. The other task consists of developing a model of plain concrete, which accurately portrays its nonlinear, multiaxial behavior and which is computationally feasible for use in conjunction with the mixture theory. The mixture theory is designed to synthesize the global constitutive properties of reinforced concrete from the properties of plain concrete, steel, interfaces and reinforcing geometry. The progress made during the course of the program toward achieving the above research objectives is summarized. A detailed

ABSTRACT: (U) When considering using databases to represent incomplete information, the relationship between two facts where one may imply the other needs to be addressed. In relational databases, this question becomes whether null completion is assumed. That is, does a (possibly partially-defined) tuple imply the existence of tuples that are less informative than the original tuple. We show that no relational algebra, that assumes equivalence under null completion, can include set-theoretic operators that are compatible with ordinary set theory. (Author)

ABSTRACT: (U) A method for predicting the downstream development of momentum thickness, skin friction, and heat transfer in a supersonic turbulent boundary layer over a rough flat plate based on ideas of Van Driest, Rotta, and Bradshaw is derived and discussed. Admissible thermal boundary conditions include the case of prescribed wall temperature and the case of an adiabatic wall. The velocity profiles for compressible nonadiabatic flow are expressed as transformations of the corresponding velocity profiles in incompressible adiabatic flow. Analytical curve fits to the experimentally determined law-of-the-wall (including the sublayer region) are given, as are analytical representations of the effects of sand grain roughness based on the well known data of Nikuradse. A FORTRAN source code for implementing the method is included as are sample calculations of the momentum thickness, skin friction, and heat transfer for several roughness heights. (Author)

UNCLASSIFIED REPORT

ABSTRACT: (U) The objectives of this research were to improve our understanding of solar flares and solar flares and solar coronal loops. The specific approach to the flare objective was to analyze and interpret solar flare data, using theoretical methods developed as part of the research. The specific approach to the coronal loop objective was to investigate their thermal and magnetohydrodynamic stability for various physical models. The principal result of the flare research was to demonstrate that, in two well-observed flares, the mechanism of chromospheric evaporation accounts for the observed amount of flare X-ray plasma. The dominant energy transport mechanism is thermal conduction. Heating by energetic electrons is of secondary importance. The principal results of the magnetohydrodynamic stability analyses were demonstrations of the role of radiative energy loss, compressibility, magnetic field line twist, foot-point magnetic field line tying, and radial plasma pressure gradient.

UNCLASSIFIED REPORT

ABSTRACT: (U) Credibility theory refers to the use of linear least-squares theory to approximate the Bayesian forecast of the mean of a future observation; families are known where the credibility formula is exact Bayesian. Second-moment forecasts are also of interest, for example, in assessing the precision of the mean estimate. For some of these same families, the second-moment forecast is exact in linear and quadratic functions of the sample mean. On the other hand, for the normal distribution with normal-gamma prior on the mean and variance, the exact forecast of the variance is a linear function of the sample variance and the squared deviation of the sample mean from the prior mean. Buhlmann has given a credibility approximation to the variance in terms of the sample mean and sample variance. This paper presents a unified approach to estimating both first and second moments of future observations using linear functions of the sample mean and two sample second moments; the resulting least-squares analysis requires the solution of a 3 x 3 linear system, using 11 prior moments from the collective and giving joint predictions of all moments of interest. Previously developed special class follow immediately. For many analytic models of interest, one can replace the 3-dimensional joint prediction with three independent credibility forecasts using the natural

ABSTRACT: (U) The nerve agent soman (0.080 mg/kg s.c.), as well as other organophosphates in concentrations that cause cholinergic symptoms, DFP (1.5 mg/kg s.c.), paraoxon (0.23 mg/kg s.c.), and tertiary (0.2 mg s.c.) and quaternary phospholine (0.080 mg/kg s.c.) induced a progressive, dose-related necrosis in rat skeletal muscle fiber. The severity of the myopathy depended on a critical decrease and duration of AChE inhibition. The fast type II fibers appeared to be the more affected fibers in all muscles tested. The necrotic nerve fibers were repaired within one week. Examination of muscle fibers 2 and 3 weeks after a single injection of soman showed a large number of ragged red fibers in the diaphragm and soleus muscle. Following AChE inhibition, the 4S molecular form of AChE showed the fastest recovery as compared with the 10S, 12S and 16S forms. The half-time recovery rate of AChE after inhibition depended on the inhibitor used and the tissue investigated. In general, half-time rate of recovery was slowest in brain and nerve and fastest in SOL and EDL muscle. AChE activity of peripheral nerve was barely inhibited by soman and had recovered to control activity within 24 hours.

ABSTRACT: (U) Work thus far has focused on a class of tricyclic antidepressants (TADS) whose action has a gradual onset associated with the metabolic response to the drugs. Chronic treatment of rats with TADS sensitized synaptosomal adenylate cyclase (AC) to activation with guanyl nucleotides. The research has attempted to describe anatomical and functional localization of the response, probe the biochemical mechanism of observed effects; and look for behavioral correlates of biochemical changes. An interesting finding is that unlike the hypothalamic or cortical enzyme, enzyme, cerebellar synaptosomal AC is not sensitized to nucleotide activation. Other TAD associated changes are seen in cerebellum. A number of plausible biochemical mechanisms for the observed TAD responses have been investigated, and several additional possibilities have been identified. The precise mechanisms involved remains unclear. Several behavioral tests were employed to attempt to quantify observed behavioral differences between control and TAD-treated animals. The most significant observed differences was in the range and variance of responses between groups. More sophisticated and sensitive experimental paradigms are being developed.

ABSTRACT: (U) This paper indicates how exponential random variables can be efficiently used in a variety of simulation problems. One of the problems is the simulation of order statistics from a normal population. The authors discuss the general problem of simulating order statistics and then consider the normal case. They start by showing how the Von-Neumann rejection approach via the exponential can be modified to become an efficient algorithm for generating a normal and then present a method for generating normal order statistics. They show how to use the exponential to efficiently simulate random permutations with weights. They consider the problem of simulating a 2-dimensional Poisson process both for a homogeneous and nonhomogeneous Poisson process. (Author)

ABSTRACT: (U) Pointwise Weak Law of Large Numbers and Weak Law of Large Numbers in the norm topology of $D(0,1)$ are shown to be equivalent under uniform convex tightness and uniform integrability conditions for weighted sums of a sequence of random elements in $D(0,1)$. Uniform convex tightness and uniform integrability conditions are jointly characterized. Marcinkiewicz-Zygmund-Kolmogorov's and Brunk-Chung's Strong Laws of Large Numbers are derived in the setting of $D(0,1)$ - space under uniform convex tightness and uniform integrability conditions. Equivalence of pointwise convergence, convergence in the Skorokhod topology and convergence in the norm topology for sequences in $D(0,1)$ is studied. (Author)

ABSTRACT: (U) To a great extent the techniques for analysis and restoration of images has been developed under the assumption that the system is linear shift-invariant (LSI). These techniques are successful in some cases because a system which is diffraction-limited or a system whose object plane undergoes uniform linear motion perpendicular to the system reference axis does indeed satisfy these assumptions. However, LSI systems are singled out for study mainly because of the widespread understanding of the Fourier Transform theory along with well-known fast algorithms for its implementation. In comparison with LSI systems, very little work has been done on linear shift-variant (LSV) systems. Most of the research on two dimensional LSV systems has been done on restoration techniques by means of coordinate transformations. This technique decomposes the LSV system into a distortion of the input plane followed by a shift-invariant operation and terminated by a distortion of the output plane. The primary objective of this research is to provide not only a mathematical structure for the state-space modeling of discrete LSV systems but to apply this model to the problems of efficient analysis and deconvolution of multidimensional systems.

ABSTRACT: (U) Research on new photoinitiator systems and improved photopolymers for photochemical machining with lasers has resulted in the successful laboratory demonstration of crossed-beam polymerization, although some single-beam polymerization still occurs under the condition examined to date. Porphyrin sensitizers and acrylate polymers have given the best results so far, especially when the samples are first degassed under vacuum to remove oxygen. A computer-controlled three-axis translation stage has been constructed to move the sample relative to the (fixed) laser beams. Future work will be directed toward continued improvement of the polymer materials. (Author)

ABSTRACT: (U) This research was directed towards
developing a methodology for partitioning choice-reaction
time into component parts, using both the additive-factor
and the subtractive method. This methodology involved the
use of a modified Sternberg task in which the subjects
viewed two horizontally presented letters and were
required to classify each of the letters into either the
positive or negative set. The classification procedure
was performed by depressing two response keys on the same
trial. Latency measures were obtained for the elapsed
time between stimulus onset and the first response and
between the first response and the second response. Input
and output times were then derived. In addition, three
different types of interruption stimuli (auditory, visual
and auditory-visual) were presented at various times
prior to and after the onset of the classification
stimulus. Input and output latencies were differentially
influenced by the different types of interruption stimuli
and by the onset time of those interruption stimuli.

UNCLASSIFIED REPORT

ABSTRACT: (U) This report concludes our study of large-scale vectorized numerical analysis applied to time domain seismic wave phenomena in filled basins. Applications include calculations of waves from simple surface or buried sources in a variety of idealized 2-D Basin and Range models (36,000 to 120,000 nodes) described in an interim report, and one large 3-D model (400,000 nodes) from Yucca Flat, Nevada Test Site, described here. Analysis is based on an explicit, finite element, elastic wave solver designed for vectorized execution on the CRAY-1. The primary result of the present 3-D study is that, given the database available from investigations in Yucca Flat, Nevada Test Site, the size of feasible 3-D computational models on the CRAY-1S is adequate to simulate elastic wave fields and interpret arrivals for comparison with existing 3-D ground motion data. Synthetic seismograms from a 400,000 element 3-D simulation of the COALORA event at Yucca Flat indicate that a significant source of transverse motion on radial lines through the source is diffraction from a discontinuity in the Rainier Mesa tuff layer across the Yucca fault. Successful time-domain simulations in 3-D are feasible with pipelined supercomputers but optimal processing requires careful tailoring of the algorithm to vectorize inner code loops and eliminate nonessential

ABSTRACT: (U) An exact solution for the angular-spatial moments of the Spencer-Lewis equation is given, along with methods for reconstructing the electron density function. The new solution techniques is implemented in a computer code and several sample calculations are carried out with monoenergetic plane sources of electrons in infinite media of aluminum and carbon. The sample calculations produce the electron distribution in space and path length rather than some integrated quantity such as the energy deposition profile. Such analytic solutions are intended to serve as benchmarks for testing numerical electron transport codes. (Author)

ABSTRACT: (U) Under a Phase I SBIR effort, an existing Navier-Stokes cascade computer code has been automated and recoded to form a design oriented cascade calculation procedure. The procedure consists of two distinct codes which are (1) the coordinate generation code and (2) the Navier-Stokes solver. With the revised procedure, the coordinate generator allows a new user to obtain coordinate systems with a minimum of input data. The Navier-Stokes procedure has been recoded to minimize required input and to decrease run time per time step. In addition, a run protocol has been developed to obtain rapid convergence. A demonstration calculation has been run which yields a converged solution in less than 300 CPU secs of unvectorized CRAY-1 run time. (Author)

ABSTRACT: (U) This report describes the research results
on Honeywell's Hierarchical Multisensor Image
Understanding program. Honeywell is developing a unified
framework for the different hierarchical levels of image
processing such as segmentation, detection,
classification, and identification of outdoor scenes and
across different sensor modalities such as millimeter
wave, infrared, and visible. Current activities on the
project are reviewed under the following headings: (1)
artificial-intelligence-based generic image segmentation
and object recognition; (2) evidence-confidence paradigms
for image understanding; (3) hierarchical systems theory
for control structures; and (4) invariant methods in
image understanding. Also discussed are scene analysis
and attributed graphs.

UNCLASSIFIED REPORT

ABSTRACT: (U) This interim report documents the work done to this point on Autoregressive Integrated Moving-Average (ARIMA) model-based analysis of myoelectric signals. The ARIMA modeling procedure and the hardware required for collecting myoelectric data are described in detail. Pattern analysis methods for characterizing the myoelectric signals under different levels of alertness/workload are discussed. Additionally, the various tasks in the Experimental Control Package that subjects must perform while being monitored are described. Finally, an analysis of data obtained during experimental sessions is provided giving some indication of discriminability of the ARIMA signatures over different task difficulty levels and subjects. Results of this analysis indicate that the first AR parameter is the most useful feature in differentiating workload/alertness level. Additionally, this feature was shown to be reliable for each underlying level of alertness or load in a given task.

ABSTRACT: (U) This report discusses the following subjects: A New Rapid Acquisition Technique for Direct Sequence Spread Spectrum Communications. The rapid acquisition technique described here can be used in direct sequence spread spectrum systems. The technique employs a double threshold which defines when a decision can be made. These thresholds change at each examination instant. Using this technique a significant reduction in the acquisition time of a direct sequence spread spectrum signal is obtained. A New Double Threshold Acquisition Scheme Applied to the Fading Channel in Frequency Hopping Spread Spectrum.

ABSTRACT: (U) A program to investigate direct laser writing for semiconductor processing is described. In this program the following results were obtained: The first reported fabrication of submicrometer diffraction gratings in GaAs; Development of a new technique for writing patterns of the dielectric material, SiO₂; Measurement of the conductivity and properties of metal interconnects; The first demonstration of laser-enhanced plasma etching; and The first observation of deep-UV enhanced liquid etching of GaAs.

UNCLASSIFIED REPORT

ABSTRACT: (U) Human velocity discrimination depends on the precise detection of minute time variations (under 1 msec). A physiological summation process called 'sequential recruitment' is responsible for this remarkable temporal sensitivity. Precise velocity discrimination is possible with very brief target durations (less than 100 msec). The oculomotor systems used this sensory signal to initiate smooth pursuit eye movements.

ABSTRACT: (U) An intense relativistic electron beam cannot propagate in a metal drift tube when the current exceeds the space charge limit. Very high charge density and electric field gradients (100 to 1000 MV/m) develop at the beam front and the electrons are reflected. When a neutral gas or a plasma is present, collective acceleration of positive ions occur, and the resulting charge neutralization enables the beam to propagate. Experimental results, theoretical understanding, and schemes to achieve high ion energies by external control of the beams front velocity will be reviewed. (Author)

ABSTRACT: (U) A theoretical study has been made of the shallow donor and Wannier exciton within a one-dimensional quantum well. The variational method was used with a cylindrical Gaussian basis set. In order to facilitate comparison with future experimental measurements of excited states of these systems, an external magnetic field was assumed perpendicular to the interfaces between the barrier material and the well. Calculations reveal that the choice of matching conditions used at the interfaces has little effect on the binding energies of the ground or first few excited states of the shallow donor, except for well widths considerably smaller than the effective Bohr radius. The results of calculations of the shallow donor ground and first few excited states are presented for a variety of well sizes and magnetic field strengths. Similar results are given for the ground state of the Wannier exciton. (Author)

ABSTRACT: (U) The Honeywell oculometer has a noise level of about 0.1 deg(2); eye tracking is noisier than head tracking; vertical eye tracking is noisier than horizontal eye tracking. It has about 25% crosstalk of the horizontal channel into the vertical channel. It has an 84 ms time delay. It is not effective at detecting and rejecting eye blinks; typical eye blink artifacts last 50 to 200 ms. The human tracks best when tracking with eyes alone. Although tracking with head and eyes should be more natural, the human does worse when he uses his head. Head only tracking is the worst of the three conditions.

ABSTRACT: (U) A chemically reacting shear layer between various gases was investigated in a new type of blow-down wind tunnel. The gas streams were inert (helium, nitrogen or argon), but carried up to 10% concentration of reactants, one being ozone and the other nitric oxide. The resulting reaction, $O_3 + NO$ yields $NO_2 + O_2$, was essentially diffusion limited and spontaneous, enabling the temperature rise to be varied at will from zero up to 200 C mean. Flows of Reynolds number up to 5×10^5 to the fourth power were investigated.

DESCRIPTORS: (U) *Turbulent boundary layer, *Chemical reactions, *Heat of reaction, Shear properties, Layers, Blowdown, Wind tunnels, Reynolds number, Flow, Helium, Argon, Gases, Ozone, Nitrogen oxides

ABSTRACT: (U) During the reporting period, Cerenkov Maser resonators with a rectangular configuration were analyzed, constructed and experimentally tested. All of the previous work was based upon cylindrical resonators, a choice which was convenient because of the intrinsic symmetry of the beam transport and focussing. In many potential applications, however, an amplifier would be more useful than an oscillator and a structure which, coupled to a linearly-polarized field would then be far more convenient. It was for this purpose that the rectangular dielectric slab waveguide structures were analyzed and tested.

ABSTRACT: (U) It is well known that explosive-based
propellants are susceptible to detonation from the
controlled deflagration mode of combustion. In some
instances a confined zone of granulated propellant
adjacent to a zone of cast propellant can provide a rapid
enough pressure-rise rate to shock initiate the cast
material. If the cast propellant has voids, the
detonation will initiate at some location ahead of the
granulated bed/cast material interface. This report is a
summary of the research activities that focus on the
analysis and modeling of the physics of such highly
transient flows.

ABSTRACT: (U) In an effort to understand certain ideas and concepts associated with multi-grid iterations the authors give an in-depth study of a particular simple problem. They consider a standard finite-difference system associated with a two-point boundary value problem. $-(pu' + bu' + qu = 0, u(0) = u(1) = 0$. The operators Ih_{2h} are 'operator' based interpolation and projection operators while the smoothers are the damped Jacobi iterations with parameter $\alpha > 0$. This document determines the exact rates of convergence for the two-grid scheme and upper bounds for the multi-grid schemes. Experimental results are discussed. (Author)

ABSTRACT: (U) In electrophysiology, the Event Related Potential is assumed to be composed of several underlying component wave forms. Principal Component Analysis is a statistical technique that has been used to uncover the components by analysis of the observed wave form. The mathematical assumptions behind Principal Component Analysis are examined, and their plausibility is questioned. It is pointed out that under certain conditions the component forms may not accurately be recovered by Principal Component Analysis. Under other circumstances violations of some of the mathematical assumptions does not appear to affect the accuracy of recovery of component waveforms. The points made are illustrated by an analysis of simulated wave forms constructed from known components.

ABSTRACT: (U) This analysis is aimed at the near-wall processes in an injected, axisymmetric, viscous flow. It is a part of an overall study of solid propellant rocket instability, in which cold flow simulation is evaluated as a tool to elucidate possible instability-driving mechanisms. One such prominent mechanism seems to be visco-acoustic coupling, as indicated by earlier detailed order of magnitude analysis. The major component of the overall study involves numerical simulation of the full set of coreflow equations of motion (nonsteady, axisymmetric) by a modified McCormack integration technique. To clarify some of the physical interactions inherent in the various regimes of the flowfield, two (separate) singular perturbation analyses have been carried out. The head-end boundary regime, and the injected sidewall layer, both involve appreciable viscous dissipation, and hence are characterized by predominantly parabolic differential systems. The inverse square root of the injection Reynolds number serves as a small-perturbation quantity.

ABSTRACT: (U) We examine methods of implementing queries about relational databases in the case that these queries are expressed in first-order logic as a collection of Horn clauses. Because queries may be defined recursively, straightforward methods of query evaluation do not always work, and a variety of strategies have been proposed to handle subsets of recursive queries. We shall express such query evaluation techniques as 'capture rules' on a graph representing clauses and predicates. The essential property of capture rules is that they can be applied independently, thus providing a clean interface for query-evaluation systems that use several different strategies in different situations. We show how rules suggested previously can be fit into this framework, and we propose some new capture rules and generalizations of old ones. (Author)

ABSTRACT: (U) This report describes the progress to date on work to date under the contract. Research on planning and problem-solving systems was begun at SRI International in September 1979. Progress has been described in detail in three annual reports (1980, 1981, and 1982). The main task of this research program is to develop powerful methods of representing, generating and executing hierarchical plans that contain parallel actions. Execution involves monitoring the state of the world and possibly replanning if things do not proceed as expected. Two different approaches to these problems are being pursued under this contract. The first is heuristic; it involves building an actual computer program that provides a representation from which it then generates plans. This approach comprises the majority of the effort in this project. The second approach is to investigate the theoretical foundations of planning. This will not, in all likelihood, result in a program, but it will formalize the planning problem and one solution to it. (Author)

UNCLASSIFIED REPORT

ABSTRACT: (U) This paper presents new algorithms for
 estimating the spatio-temporal spectrum of the signals
 received by a passive array. The algorithms are based on
 the eigenstructure of the covariance and spectral-density
 matrices of the received signals. These allow partial
 correlation between the sources and thus are applicable
 to certain kinds of multipath problems. Simulation
 results that illustrate the performance of the new
 algorithms are presented. (Author)

ABSTRACT: (U) A multi-disciplinary program for space-
based image processing is reported. This project combines
optical and digital processing techniques and pattern
recognition, image understanding and artificial
intelligence methodologies. Time-change image processing
was recognized as the key issue to be addressed. Three
time-change scenarios were defined based on the frame
rate of the data change. This report details the recent
research on: various statistical and deterministic image
features, recognition of sub-pixel targets in time-
varying imagery, and 3-D object modeling and recognition.

ABSTRACT: (U) In this paper the authors introduce a new
adaptive antenna system able to work well even when the
desired signal and the interference are coherent. The
present adaptive beamformers fail to operate in these
cases. The results of simulations appear to confirm the
theoretical predictions. (Author)

ABSTRACT: (U) In this paper we consider approaches to updating databases containing null values and incomplete information. Our approach distinguishes between modeling incompletely known worlds and modeling changes in these worlds. As an alternative to the open and closed world assumptions, we propose the modified closed world assumption. Along with the discussion of updating, we address some issues of refining incompletely specified information. (Author)

UNCLASSIFIED REPORT

ABSTRACT: (U) The goal of this work is to identify the processing flaws that limit the strength of sintered ceramics, and to engineer uniform microstructures which either eliminate or minimize the size of these processing flaws. During the first year, a major advance was made by uncovering the fact that agglomerates in powders produce crack-like voids that severely limit the strength of sintered ceramics. Crack-like voids produced by the differential sintering of agglomerates relative to their surrounding powder matrix can be the most detrimental strength degrading flaw in sintered ceramics. As detailed and summarized in the review prepared for a 1984 ASM Conference on Materials for Future Energy Systems, colloidal approaches to powder processing and consolidation can minimize the size of soft agglomerates (those that can be broken apart with surfactants) and hard agglomerates (eliminated by sedimentation of colloidal suspensions). Work has shown that the elimination of the large, soft agglomerates with surfactants increases the average strength of a transformation toughened Al₂O₃/30 v/o ZrO₂ (2.5 v/o Y₂O₃) composite from 550 MPa (80,000 psi) to 930 MPa (135,000 psi).

ABSTRACT: (U) The combined results of the first three years of the program are presented, with emphasis on the stress corrosion cracking and hydrogen embrittlement of the PM 7090 Al alloy. Additional results on 7075 are also given. In particular, the role of temper and loading mode in susceptibility were examined for three test methods---time to failure of notched round bar specimens in a brine solution; straining electrode tests on notched round specimens under cathodic charging; and tensile tests on hydrogen pre-charged notched round specimens. These tests form the basis for an extensive, completed Ph.D. thesis which is summarized here. Stress corrosion testing has also been conducted on 7075 in aluminum chloride solutions and on HP 7075. We remain confident that we have established the basis and a good portion of the results necessary to understand, predict and model the role of hydrogen in stress corrosion cracking of high-strength aluminum alloys.

UNCLASSIFIED REPORT

ABSTRACT: (U) This article considers the problem of determining the optimal value and corresponding optimal point of a real function F in M variables. Only function values are given and the computation of derivatives is either not practical or are not available. Bremermann introduced an ingenious and useful optimization algorithm that is guaranteed to converge for polynomials in several variables up to fourth degree. The heart of this method is the use of random directions of search together with a Lagrangian interpolation scheme. This author, having had extensive experience with this algorithm, found that the method has fast convergence at the early stages and tends to stagnate in the neighborhood of the optimal point. Motivated by the usefulness of random directions it is the purpose of this article to present an algorithm based on the proper use of interpolation schemes: (a) Lagrangian interpolations (such as those in Bremermann's methods); (b) spline approximations with variable nodes; (c) pseudo Newton steps using the spline derivatives (not the function); together with a search procedure along weighted random directions. The directions are chosen to be orthogonal using the Gram Schmidt orthogonalization procedure. This algorithm was extensively used for problem solving in mathematical biology, chemical kinetics, and general dynamical systems.

ABSTRACT: (U) The brushless direct current (DC) machine theoretically offers wide speed range torque characteristics like unto the commutator DC machine. However, in brushless DC motor drive systems there exists a performance deficiency in that at near zero speeds driven mechanical loads can respond to the pulsating component of developed torque when simple rotor position-activated switching is utilized. This report analytically develops a pulse width modulation control philosophy that reduces torque pulsations to an acceptable level. (Author)

SUPPLEMENTARY NOTE: Pub. in Jnl. of Acoustical Society of America, v75 n3 p885-881 Mar 84.

ABSTRACT: (U) This final report summarizes the experimental approach was to initially study a single alloy which exhibits a transition from brittle to ductile type erosion response at room temperature. At a later stage, the dynamic hardness of several substrate materials, both pure metals and alloys, was measured in order to provide a material property obtained under dynamic conditions similar to those during an actual erosion event. The results can be conveniently separated into two phases as follows: Erosion Material Removal Mechanisms, and Correlation Between Dynamic Hardness and Erosion.

ABSTRACT: (U) The report describes molecular-beam studies of ion-pair production, charge transfer, and measurements of the fraction of excited Na atoms in a composite beam of ground-state and excited Na atoms. Some of the experiments involved laser excited Na as a reactant. Included are investigations of the Na-Br, doubly charged Ar-Ar, Ne ion-metastable He, excited Na-Na, and Li-Na systems.

DESCRIPTORS: (U) *Collisions, *Excitation, *Atoms, *Low energy, Lasers, Charge transfer, Molecular beams, Pair production, Ions, Sodium, Argon, Lithium, Neon, Bromine

UNCLASSIFIED REPORT

ABSTRACT: (U) The Geophysics Scholar Program was initiated as a pilot program to provide new Research Scholars with one year appointments to the Air Force Geophysics Laboratory. Extensive mailings were made to technical departments at universities around the United States where programs of prime interest to the Geophysics Laboratory were established. These included Atmospheric Studies, Geophysics, Meteorology and related applied sciences. Ten Scholars were appointed beginning in September 1982 and extending through December 1982, for 12 months duration. Six of these were subsequently continued in the Geophysics Scholar Program under another contract for a second year. Five technical papers were presented by the Scholars during the year. The final technical reports on the Scholar's work are included in this report. This pilot program was judged to a success by both the Scholars and their Laboratory Associates. Their comments were solicited by questionnaire and are included. The Scholars were judged to be beneficial to the Laboratory. The opportunity of having new Research people on a short term basis was felt to be very stimulating and worth while. Their interaction with the Laboratory was very positive. At the initiation of this program, travel funds were provided only for travel to the Laboratory site at the state of the appointment and return funds at the end. Some difficulties were

ABSTRACT: (U) Methods for optical processing and holography with light of reduced coherence are described. Specifically described are: (a) a method for making holographic optical elements in light of reduced spatial coherence; (b) a method for doing real time phase conjugation in light of reduced spatial coherence; and (c) a method for doing off-axis Fourier transform holography in spatially incoherent light. (Author)

ABSTRACT: (U) A differential impedance and transit-time matching approach is used in the design of an anisotropic lens for launching TEM waves from a small source, through the lens, and onto a conducting circular conical system. This approach leads to a system of ordinary differential equations which may be solved exactly to obtain the lens parameters. An approximate solution, which would be applicable to a design procedure, is also given. (Author)

ABSTRACT: (U) Films of VN as thin as 5 nm have been made by nitriding V films at high temperature. Tunnel junctions have been successfully made using both oxidized and nitrided amorphous Si barriers. Spin-polarized tunneling results show VN to have a small spin-orbit interaction, but larger than Al. Tunnel junctions have been successfully made on V3Ga and spin-polarized tunneling shows spin splitting up to 20 Teslas. Structure and compositional analysis of the V3Ga films has been carried out. We have successfully made high transition temperature Nb films as thin as 5 nm.

ABSTRACT: (U) The effect of temperature, pressure and time on the rate of densification of submicron alumina powder during hot isostatic pressing has been determined using a dilatometer to continuously monitor volumetric changes. A Fortran computer program is used to make corrections for thermal expansion of the alumina and the stainless steel can, to determine the relative density of the alumina compact at any point, and to produce report ready graphs depicting the relationship between any two prescribed variables. Analysis of other errors associated with the use of the dilatometer shows that these are negligible compared with thermal expansion effects. The rate of densification is controlled by an interface reaction mechanism never previously observed in the densification of alumina. Mass transport is limited by the movement of grain boundary dislocations which act as sites for atoms to detach from grains. The actual rate limiting process is the diffusion of solute in the lattice since the motion of solute atoms can result in a large number of atoms being freed from a grain boundary dislocation. Once separated from the dislocation the atoms quickly diffuse away.

DESCRIPTORS: (U) *Ceramic materials, *Isostatic pressing, *Packing density, Powders, Aluminum oxides, Stainless steel, Hot pressing, Diffusion coefficient, Porosity, Grain size, Dislocations, Physical properties, Mechanical properties, Thermal expansion, Algorithms, Mathematical

ABSTRACT: (U) Research on the development of new photoinitiator systems for spatially selective photochemical machining with lasers has continued smoothly and is progressing well. The porphyrin system developed during the first quarter continues to look particularly promising. A number of potential new candidate materials have also been identified, including a rubrene sulfonyl chloride derivative. Experimental study of these new compounds was begun during the past quarter and is expected to continue for several more months to define materials properties and optical parameters have been carried out to guide this effort. (Author)

ABSTRACT: (U) This Minigrant work followed the author's effort in the 1982 Summer Faculty Research Program at WPAFB developing a prototype GaAs FET computer model. During the Minigrant work, the computer model was developed, tested and run extensively. Development included using true GaAs velocity overshoot correctly in the model, greatly increasing model speed, evolving an improved way to handle carrier transport, studying conduction through the semi-insulating substrate, handling individual cell doping and mobility, testing the model for valid capacitance calculations, testing the model for Gunn oscillations in a diode configuration (and obtaining good results), and use of rectangular cells rather than the original square ones. ABSTRACT: (U) The techniques of deep level derivative absorption spectroscopy (DLDA), photoinduced-transients-spectroscopy (P.I.T.S.) were employed to study deep levels and interfaces in Ga As. Optical transitions due to impurities and structural imperfections were observed by (DLDA) which can be correlated with levels observed by (P.I.T.S.). Raman measurements were used to study changes in the surface depletion layer width of Ga As as a result of oxidizing and reducing plasma treatments; in addition, the local strain in Ga As due to various thicknesses of silicon nitride were studied by observing the shift of the LO phonon frequency. EVL08F

ABSTRACT: (U) This report deals with the phase estimation of low-time-bandwidth product (TBP) signals. Phase and frequency of a signal is estimated for short observation time. The observation time or the spectral bandwidth is limited to the superresolving regime where the TBP is near unity. Two classes of signal estimation are presented. Superresolving frequency estimation is performed where the sinusoidal signals are buried in deep white Gaussian noise. Constrained optimization techniques, using linear programming are used to estimate the location of the spectral peaks of the sinusoidal signals. Time and frequency limited Hilbert transform analysis is used to reconstruct the phase from the amplitude, and the amplitude from the phase of a complex signal. In addition, three smoothing methods; a mathematical filtering method, a correction factor method, and a method of spectral partitioning, are used to improve the phase/amplitude estimate of the complex signal. (Author)

UNCLASSIFIED REPORT

ABSTRACT: (U) A measurement program in which a proton beam irradiates sensitive electro-optical sensors used in spacecraft systems has been prepared. The progress reported during this period includes device procurement and testing of photomultiplier tubes at the Los Alamos Meson Physics Facility. The micropulse structure of the LAMPF beam is ideal for measuring transient response of the photomultiplier tubes. Each tube was placed in the beam head on so that all parts were exposed and side on so that only the electron multiplier was irradiated.

ABSTRACT: (U) The second-year results of an effort to introduce computer automated signal analysis and pattern recognition procedures to the study of blast-induced ground motion is presented. Intermediate results involving the characterization of ground motion acceleration records to identify ground spall versus no spall regions is reported. A computerized procedure extracted information from the time, frequency, and cepstrum description of the signal. These signal features were then incorporated into a Fisher's Linear Discriminant (FLD) pattern recognition procedure. Procedures to identify good and bad features are reviewed. This identification seems to be required for the efficient and effective application of the FLD. (Author)

ABSTRACT: (U) Various theoretical models were examined in the light of recent developments in the theories of interacting continua. Computer programs were developed to implement the popular 'engineering' approach to liquefaction. Ghaboussi's incompatible finite element model was compared with higher order elements to select the best model based on accuracy and economy. Numerical performance of special finite elements to model line singularities that occur at free draining loaded surfaces just after application of the load was documented. Biot's theory of wave propagation in fluid-saturated media was implemented in a computer program following Ghaboussi and Wilson's procedures for linear elastic soils. The computer models were verified against available results in the literature on the subject and against theoretical solutions, for one-dimensional problems, based on Biot's theory. Work was started on setting up laboratory experiments for verification of the theory. Necessary equipment and instrumentation was acquired. (Author)

ABSTRACT: (U) This report summarizes research accomplishments in five major task areas: (1) Data Bank Acquisition, Emphasizing Satellite Data Over the Western U.S. and China. (2) Synoptic Studies Associated with Severe Weather Events. Two events of vortex development over Tibet, with subsequent heavy rainfall and flooding along the eastern slopes of the plateau, were analyzed in detail for later comparisons with numerical model results. Analyses of data from the western United States revealed the existence of a pronounced monsoon circulation system, and of a diurnally varying plateau circulations system. Both systems have a profound effect on the development of mesoscale convective complexes (MCCs) over the western United States. (3) Numerical Modeling. A mesoscale numerical model was developed which has yielded excellent results over Tibet in two case studies of vortex development and heavy precipitation. A number of parameterization schemes, mainly concerned with surface energy fluxes, are now under investigation to allow improved model forecasts over the western United States.

ABSTRACT: (U) In this report progress in development of a monolithic SAW silicon resonator is described. Specific studies and results in the areas of piezoelectric films for generation and detection of SAW are presented. A multi-mode SAW resonator using thin film ZnO on silicon was designed, fabricated and characterized. Methods were developed for a new technique of fabricating silicon SAW resonator cavity using orientational etching. It was concluded that this type of etching results in well-defined sidewall structures for reflector cavity element, producing a superior resonant performance with lower phase noise than conventional SAW resonators. Automated measurement equipment was employed to evaluate devices and confirm equivalent circuit models. Device performance very closely matched original circuit models showing excellent confirmation of design parameters. (Author)

UNCLASSIFIED REPORT

ABSTRACT: (U) Passive control of shear layer turbulence was investigated experimentally for low subsonic velocity jets from circular nozzles by studying effects of modifying nozzle exit geometry. Indeterminate origin (I.O.) nozzles used, including slanted, stepped and crenelated exit geometries, were so designated because streamwise location of the nozzle lip varies with azimuthal position, unlike standard nozzles for which the entire termination is at the same streamwise location. Flow visualization and detailed hot-wire measurements were used to observe development and interaction of large-scale turbulent structures in shear layers originating from various sectors of the I.O. nozzles, to determine the influence of instability wave patterns on ensuing flowfield characteristics and to relate observed evolution of three-dimensional large-scale turbulent structures to global properties of the jet flowfield such as velocity profiles and shear layer spreading rates as a function of streamwise distance and azimuthal angle. Results showed pronounced asymmetries in shear layer growth rates, which could be controlled by varying nozzle parameters. The asymmetries were also confirmed by measurements of azimuthal variation of shear layer turbulent energy as well as mean-velocity profiles. Detailed features of energy transfer from the mean flow into successively

AD-A143 831

ABSTRACT: (U) This report contains a summary of the results of the first two years, and the results obtained during the third year of research in the mathematical problems associated with the analysis and design of Air Force sensor correlation and data fusion systems. These systems play a vital role in the command and control process, but presently there exists no systematic and quantitative methodology for their analysis and design. In the first year of research ALPHATECH investigated an important subproblem: the distributed detection problem associated with determining the presence or absence of targets from a collection of distributed sensors. In the second year of research, ALPHATECH obtained novel exact expressions for the probability density function of the local log likelihood ratios used in distributed detection problems, and has used these expressions to generate an extensive set of design curves. In the third year of research, ALPHATECH investigated another important class of problems, namely, sequential distributed detection problems. Three such problems were formulated: the infinite horizon decentralized Wald problem; a decentralized Quickset Detection problem; and a sequential distributed detection problem with communication and ordered stopping times. The qualitative properties of the optimal solution for the decentralized Wald and the decentralized Wald problem and the

ABSTRACT: (U) The major emphasis of this report is on a new and novel surface acoustic wave (SAW) device which has been developed under this grant for use in the nondestructive determination of the electronic properties of semiconductors. The technique uses surface acoustic waves on a piezoelectric substrate. The electric field associated with the SAW interacts with free carriers of a semiconductor placed near the piezoelectric surface. The interaction generates detectable currents in the semiconductor and attenuates the SAW. By observing these effects while varying external parameters such as temperature, applied acoustic power, SAW frequency, semiconductor surface irradiation and bias voltage, the desired information is obtained. The properties that can be determined by this non contact technique include the bulk and surface conductivity, generation lifetime, surface recombination velocity, the location in the energy gap of traps, surface states, and interface states, trap emission and absorption times and storage times in the depletion layer.

UNCLASSIFIED REPORT

ABSTRACT: (U) The project comprised an experimental study of the electronic and vibrational properties of superconducting materials by means of Mossbauer spectroscopy. From the temperature dependence of the Mossbauer parameters of tin in the oxide superconductor Ba(Pb_{0.87}Sn_{0.03})BiO₃, phonon softening, characteristic of displacive transitions, was found to take place above the superconducting transition temperature. This observation is hence important for understanding the superconducting properties of the perovskite compounds. The Mossbauer effect at Sb121 in BaPb_{1-x}(Bi₁Sb_x)O₃ shows that Sb is 5+. The range of stability of the perovskite compounds was determined in the ternary systems Ba(Pb-Sn-Bi)O₃ and Ba(Pb-Sb-Bi)O₃. The composition dependence of the superconducting transition temperature was determined for both ternary systems. Conversion Electron Mossbauer Spectroscopy has been applied to the study of Nb₃Sn superconducting films. This total has been found to provide a unique probe of the electronic and vibrational properties of thin film materials.

ABSTRACT: (U) Experimental techniques were developed and used for the unambiguous identification of donors in high-purity epitaxial GaAs, InP and related compounds. Magnetic fields up to 20 T and high-resolution submillimeter spectroscopy were used to distinguish the Zeeman transitions ($2p(m=1)$) of each different donor and to describe the dependence of the line shape on field intensity. Transmutation doping was used to distinguish Se and Ge donors, molecular beam epitaxy to distinguish Sn. These methods were extended to InGaAs near millimeter wavelengths. Finally, the magnetic field dependence of the spin doublet in GaAs was measured.

ABSTRACT: (U) This report summarizes the scientific achievements and activities sponsored by the Air Force Office of Scientific Research under Grant AFOSR 80-0170 for the period August 1, 1982 - July 31, 1983. The report is divided into parts. Part I relates to the achievements and activities in the area of design of experiments and Part II relates to the achievements and activities in the area of reliability models. (Author)

UNCLASSIFIED REPORT

ABSTRACT: (U) Testing is the process of inferring the correctness of a program based on information collected during program execution. This process is called error-based when the information collected is used to infer that certain errors are not in a program. It is assumed here that a program can only be incorrect in a limited fashion specified by associating alternate expressions with program expressions. Substitution of an alternate expression for a program expression yields an alternate program that is potentially correct. The goal of error-based testing is to differentiate the program from each of its alternates. Two types of error-based testing are given. In static error-based testing the code is analyzed to produce two conditions. A creation condition describes when a class of alternate expressions will affect the program state. A propagation condition describes when an alternate program state will affect the output. If the output of the program is correct and both conditions are satisfied, all alternates are faults detected by the test set. In dynamic error-based testing information is first collected from test executions. It is then proved that certain alternate programs are eliminated. A particular form of dynamic error-based testing based on symbolic execution is presented. In symbolic testing program expressions are replaced by symbolic alternatives that represent classes of alternate expressions.

ABSTRACT: (U) During this period, the investigators have
focused on how to increase the power of programming
languages for building man-computer dialogues. More
specifically they see such dialogues in terms of a
network of screens that might potentially be communicated
to the end user. Different screens of data are shown
depending on user responses. A programming language must
make it easy to specify a network of such screens,
describe the layout of any particular screen, and provide
editing capabilities, validity checking of inputs, and
scrolling capabilities. (Author)

Science.

ABSTRACT: (U) This paper considers the problem of
simulating a large network N of processors using a small
set of p processors. The approach taken is to partition
the nodes of N into p subsets $N_{sub 1}$ to $N_{sub p}$ and to
assign each subset to a processor for simulation. In
order to equalize the workloads of the processors, the
sizes of $N_{sub 1}$, $N_{sub p}$ should be as equal as possible;
and in order to minimize (and equalize) the amount of
message passing between the processors, the number of
pairs of nodes that are neighbors in N but belong to
different subsets should be as small (and as equal) as
possible. The authors discuss the general problem of
partitioning a graph N so as to satisfy these criteria,
and also consider the particular case of partitioning a
tree. (Author)

ABSTRACT: (U) This research concerned three independent projects of ICMA (Institute of Computational Mathematics and Applications) personnel, each belonging to the general area of computational fluid dynamics. The first project dealt with the computation of stationary Navier-Stokes solutions using continuation methods. Error estimates for certain finite element solutions of continuation problems were derived and extensions to more general operators including the Navier-Stokes operator were investigated. Numerical methods for the detection of Hopf bifurcation were studied. The second project involved construction, analysis and implementation of efficient computer algorithms for the finite difference and finite element-dual variable discretization of the two-dimensional Navier-Stokes problems. Particular attention was given to finite element and finite differences discretization such problems that arise in combustor modeling. The third project sought to extend the dual variable reduction technique to various fluid models. This required the construction of a network analogue for the discrete difference equations along with an analysis of the fundamental matrix and dual variable transformation involved. (Author)

ABSTRACT: (U) Finite element algorithms are presented for the approximate solution of the streamfunction-vorticity equations of steady incompressible viscous flows. Both the linear Stokes and the nonlinear Navier-Stokes equations are considered. The methods discussed require low continuity finite element spaces and do not require any artificial specification of the vorticity at solid boundaries. Particular attention is paid to methods for multiply connected domains and to theoretical and computational estimates for the accuracy of the algorithms. Brief consideration is also given to three dimensional problems, to exterior problems, and to the recovery of the pressure field. (Author)

ABSTRACT: (U) Procedures for evaluating the thermal stability of bulk semi-insulating InP have been developed. Determination of the concentrations in semi insulating InP is a major analytical problem. Preliminary SIMS (secondary ion mass spectrometry) measurements show that significant redistribution of Fe can occur during high temperature processing. Severe degradation can occur in ion-implanted InP samples annealed with SiO₂ and encapsulated at temperatures of 750 C. The use of phosphosilicate glass dramatically reduces such surface degradation. Energy dispersive X-ray analysis (EDAX) shows that the loss of P at the surface is the cause of such degradation.

ABSTRACT: (U) An accurate band-structure theory for semiconductor alloys was achieved. It has been successfully applied to Mercury-Cadmium-Telluride alloys (MCT), and is being extended to III-V and other II-VI semiconductor alloys. As a result of this research, ten papers have been published. Several other papers and one book are in progress. The most important finding was the origin of the major disorder and its effects on different parts of the band structure. The large s-energy fluctuation between the Hg and Cd sites was found to cause a large smearing of the density of states about 5 eV below the top of the valence band, but it produced very little bowing and scattering for the states near the band gap. A detailed study of these facts accounts for the lattice instability of MCT and its very high electron mobility. Another significant result is that, while Cd weakens a neighboring Hg-Te bond, Zn strengthens it. Such structural studies may help resolve the adverse structural difficulties affecting MCT as an infrared material.

UNCLASSIFIED REPORT

ABSTRACT: (U) The purpose of this proposal is to define and determine an R-reliable interval and its associated confidence on the sum of two continuous, independent, random variables with different scale parameters. The relationship between the confidence of the R-reliable interval on the sum and the confidences of the R-reliable intervals on the summand variables was also investigated. The confidence of the R-reliable interval on the sum was defined, and the largest order statistics were chosen which simplified the expression for the confidence of the R-reliable interval on the sum. The choice of the largest order statistics led to nonparametric results for the confidences of the R-reliable intervals on the summand variables. Exponential and folded normal continuous distributions were considered, and numerical values of the confidences associated with the R-reliable interval on the sum were obtained for selected sample sizes and selected ratios of the scale parameters. A distribution-free bound for the confidence of the R-reliable interval on the sum in terms of the confidence associated with the R-reliable intervals on the summand variables was obtained. The monotonicity of the confidence of the R-reliable interval on the sum was established for specific values of sample sizes. (Author)

UNCLASSIFIED REPORT

ABSTRACT: (U) Inertial Navigation System, barometric altimeter, TACAN, and ILS are used to achieve a synergistic combination of the outputs of individual subsystems. Kalman filter is used to provide an ideal method for data processing in this multisensor navigation system. The filter design begins with the development of mathematical and statistical error models to describe the truth system. The truth model is simplified and reduced, in steps, to lower the computation burden on the on-board computer. The covariance analysis and the Monte Carlo methods of testing the performance of the Kalman filters based on reduced and simplified system models are discussed. Suggestions for further research in the area of fault detection and isolation are offered. (Author)

ABSTRACT: (U) Nonadecafuorodecanoic acid (NDFDA), a biological test model for similar compounds used to produce aqueous film-forming foams, is a potent hepatotoxin. Since the compound has been shown to modify cellular membrane systems, the effect of NDFDA on membrane-dependent functions of genetic expression has been investigated. Messenger RNA transport through nuclear pores in a cell-free system derived from rat liver, was significantly inhibited when the nucleic were derived from NDFDA-treated rats. The induction of the hepatic enzyme tyrosine aminotransferase by hydrocortisone and insulin was near normal. In contrast, pretreatment with NDFDA inhibited induction by glucagon, suggesting that some receptor or post-receptor step in the glucagon-mediated activation of the membrane-bound adenylate cyclase system was defective.

ABSTRACT: (U) Studies conducted during the initial phase of this project had two major objectives. The first was the selection of a visual-motor performance task that met the needs of (a) long term operation, (b) physiological and functional appropriateness, (c) relevance to the Air Force mission, and (d) feasibility within the resources available to us. Towards this end four video games were tested on each of six adult subjects. Evaluation of these tasks as well as EEG correlates of performance led to the selection of one for subsequent studies. Our second objective was to determine if the quantitative analysis of somatosensory EEG characteristics could yield information predictive of performance. Preliminary findings indicate that specific frequency components do, indeed, change in relation to response accuracy and speed. These consistent observations provided support for our basic assumptions and will guide the focus of subsequent studies.

ABSTRACT: (U) Fatigue crack growth has been studied in two binary Ti-Al alloys, an 8 wt.% Al and a 4 wt.% Al alloy. It has been found that the crack growth rate is faster than in the 4% Al alloy. The principal difference between the alloys is that the higher Al alloy exhibits planar slip. The effect of this planar slip character is to cause a more irregular crack path. This increase in crack path irregularity causes roughness-induced closure. Back face strain measurements have been used to measure the variation in closure and to calculate an effective delta K. It has been shown that the crack growth rates for the two alloys coincide if the variations in closure are taken into account. Elevated temperature crack growth experiments have also been conducted and oxide-induced closure effects have been found in this case. This type of closure also affects the crack growth rate. Finally, crack growth experiments at high mean stress have been conducted and it has been found that the closure effects disappear. The implications of this work on the selection of materials for fatigue crack growth limited applications is discussed. (Author)

ABSTRACT: (U) This project has been concerned with three facets of cyclic deformation of advanced eutectic composites: (a) high cycle, stress controlled fatigue; (b) stress controlled crack growth; (c) low cycle, strain controlled fatigue. Three alloys were selected for study: Nitac 14B, Cotac 744 and AG-170. Experiments have been carried out as a function of several variables: temperature, microstructure, and frequency, in order to obtain as complete a picture as possible of the relative advantages and disadvantages of the three alloys under cyclic loading conditions. In addition, the response of these alloys to cyclic deformation has been compared to that of conventional nickel base alloys. Early in the program it was noted that Cotac 744 was inferior in HCF and LCF properties to the other two alloys. Consequently, during the final year of the program LCF and da/dN tests were carried out on AG-170 and Nitac 14B only.

ABSTRACT: (U) This AFOSR SBIR Phase I Project produced explicitly the hyperfast pool/split/restitute algorithms of the Bloom technique. These algorithms, once they obtain hardware implementation, will be used as follows. They will make it possible for a sender to get all desired digital information to a receiver by coding it for transmission over several parallel channels in such a way that decoding will recover everything sent even when up to a predetermined number of channels fail. This project developed a set of design principles for hardware implementation of such p/s/r processes by means of existing microprocessors of sizes 4, 8 and 16 bits. (Author)

ABSTRACT: (U) The overall objective of this research program was to develop theoretical methods for improving the prediction of potential energy surfaces relevant to high energy inelastic collision processes. A diatomic-in-molecules approximation for constructing potential energy surfaces of excited electronic states of the prototypical triatomic hydrogen system was developed. A new approximation method was devised to estimate cross sections for inelastic or reactive collision processes from a rotating rigid rod model. These semiempirical approaches were complemented by a comprehensive statistical theory for vector properties of collisions, including all angular distributions describing the orientations of the initial and final relative velocity vectors and/or the reactant and product rotational angular momentum vectors. ABSTRACT: (U) The determination of the number of signals in a wide class of problems, including array processing, harmonic retrieval and pole retrieval, is addressed. A new approach, based on the application of the information theoretic criteria for model identification introduced by Akaike, Schwartz and Rissanen, is presented. It is shown that the criterion introduced by Schwartz and Rissanen yields a consistent estimate of the number of signals, while the criterion introduced by Akaike yields an consistent estimate that tends, in the large sample limit, to overestimate the number of signals. SUPPLEMENTARY NOTE: Presented at IEEE Conference on Decision and Control (22nd) Dec 83, San Antonio, TX.

ABSTRACT: (U) The theme of this lecture is that the availability of very high density integrated circuits will be changing our approach and emphasis to several problems in estimation and control. For example, the minimality of realizations will be less significant than their modularity, local interconnectedness, area time complexity measures, etc. Similarly, good algorithms for serial processing may be poor candidates for parallel implementation. While it is hard for me in mid-August to predict exactly what I shall say in the lecture in mid-December, I think it might be useful to provide in written form some of the background material on which a good part of my talk will be based. Thus, at this meeting at least, I plan to illustrate the above points by several examples, including: (1) description of a parallel architecture for the measurement update step (in triangular array form) of the Kalman filter; (2) development of the Schur algorithm as a better candidate than the Levinson algorithm for VLSI implementation of Toeplitz equation solvers; (3) comparison of the Berlekamp-Massey-Rissanen and Lanczos algorithms in the problems of partial realization and of the decoding of BCH codes; and (4) development of minimal, but pipelined and orthogonally-cascaded, implementations of time-invariant, finite-dimensional (ARMA) systems.

UNCLASSIFIED REPORT

ABSTRACT: (U) This paper addresses several issues arising in the modeling of discrete event processes for which the sample-path evolution depends on the past trajectory and is also controlled by an independent modulating process. While information on local, sample-path evolution is sometimes readily obtainable or measurable, in many applications it is more important to predict ensemble averaged responses to variations in the modulation process. The authors discuss this problem in the framework of a general model for rate-modulated selfexciting processes and, under certain assumptions, derive a nonlinear ordinary differential equation for approximately predicting ensemble behavior from known sample-path evolution laws. A successful application of this method to a neural encoding process has already been made.

EVL08F

ABSTRACT: (U) This interim report describes work performed during Phase II on Two-Step Holographic Fringe Linearization Interferometry. The FLI process consists of deflecting the object beam between holographic exposures to create linear fringes and spatial filtering of the image reconstructed from the hologram about the linear fringe carrier frequency. This filtering is meant to discriminate between subsurface defects and random fringe noise. During this phase a loading limitation for the FLI process (of one quarter wave/linear fringe period for out-of-plane deformations) was demonstrated. To circumvent this limitation, two modifications to the FLI process were investigated: Four-exposure FLI - a Moire technique; and Laser Pulse separation control with dynamic loading. With the former method linear fringes have been recovered from the random noise in simulated laboratory experiment. Experiments to demonstrate the fringe shifts at defect locations with differential loading are still in progress. Preliminary experiments performed on the NADC holographic system indicate that it should be adequate, albeit cumbersome, to demonstrate the Laser Pulse Control Method. The finite element analysis is predicting the experimental fringe patterns obtained with static loading; and the modeling effort for the dynamic loading experiments is discussed. Analysis for the moire

ABSTRACT: (U) This document summarizes studies on the morphology of ionospheric structure at high latitudes. The program encompasses both theoretical and experimental investigations into this rapidly developing field. Because of the vast range of scale sizes (hundreds of kilometers to centimeters) that make up the structure, and the need for time-continuous observations, we employ a diverse set of observational techniques. These include in situ observations from rockets and satellites as well as radio propagation and scattering measurements. Topics include: F-Region Cross-Field Diffusion Processes; High-Latitude Conductivity and Field Aligned Current Systems; Low-Altitude Image Striations Associated with Bottomside Equatorial Spread F--Observations and Theory; Irregularity Decay in an Isolated Plasma Bubble; Electrical Coupling Effects on the Temporal Evolution of F-Layer Plasma Structure; Aurora and Electrojet Configuration in the Early Morning Sector; Auroral Zone Conductivities within the Field-Aligned Current Sheets, and K sub P Dependence of Auroral Zone Field-Aligned Current Intensity.

UNCLASSIFIED REPORT

ABSTRACT: (U) A nozzle was designed and constructed which is to produce clusters of iodine molecules in the gas phase. Preliminary tests were conducted. A partial photoion yield curve for the production of iodine molecular ions was obtained for the wavelength region of 1216-1254 A and 1299-1346 A at an optical resolution of 1.75 A. The adiabatic ionization potential of molecular iodine was determined to be 9.309 ± 0.008 eV with a spin-orbit splitting to the next highest electronic energy state of 0.845 ± 0.008 eV. Many autoionization features were observed, but because of the limited range of the wavelength study they were not assigned to Rydberg states.

DESCRIPTORS: (U) *Photoionization, *Iodine, Ionization, Gases, Molecules, Clustering, Electron energy, Ions, Molecular beams, Supersonic characteristics, Spin states, Nozzles, Splitting, Adiabatic conditions

UNCLASSIFIED REPORT

ABSTRACT: (U) Research supported under this effort investigated some of the spectral and invertibility properties of band matrices. Spectral theory and classical approximation theory were used to give a new proof of the exponential decay of the entries of the inverses of band matrices. The problem of obtaining spectral information about a given matrix from its submatrices was studied. Another result obtained during the research effort was that for subspaces of the continuous functions on the unit interval that have B-spline like bases there is an interpolating projection whose norm depends only on the condition number of the basis. (Author)

ABSTRACT: (U) Research during this period was carried out in the general area of control theory of partial differential equations and the operation of the Modeling, Information Processing and Control Facility at the University of Wisconsin was begun. The program involves three distinct phases, all of which are under some degree of development. There is the fundamental program of research on the control theory of distributed parameter systems and the related program of research on self-excited oscillations related to flutter phenomena, the specific research program aimed at the development and improvement of control and identification strategies in connection with wing flutter problems, and the new area of distributed parameter model development and calibration in connection with the MIPAC facility. UNCLASSIFIED REPORT

ABSTRACT: (U) The results of the second year of a two
year research program in nonlinear real-time optical
signal processing are described. The research has
concentrated on optical sequential logic systems for
parallel digital processing and on variable grating mode
(VGM) liquid crystal real-time spatial light modulators.
The goal of the program is to extend fast parallel
nonlinear operations to optical processing systems with
large time-bandwidth and space-bandwidth products.
Parallel and twisted nematic liquid crystal light valve
(LCLV) devices have been used as a nonlinear element in a
feedback arrangement in the binary sequential logic
system. A computer generated hologram fabricated on an e-
beam system serves as a beamsteering interconnection
element. A completely optical oscillator and frequency
divider have been experimentally demonstrated, and
various circuit interconnection techniques have been
explored. Research has continued on variable-grating mode
(VGM) liquid crystal devices that perform local spatial

UNCLASSIFIED REPORT

ABSTRACT: (U) The fatigue behavior of short cracks, which are small compared to the scale of the microstructure, small compared to the scale of local plasticity or simply physically small (i.e., approximately 1 mm), must be considered as one of the major factors limiting the application of defect-tolerant fatigue design for airframe and engine components. Accordingly, the current program is aimed at identifying factors which govern the growth of such short cracks (in contrast to long cracks) in a series of commercial aluminum alloys, with specific reference to behavior at near-threshold levels below approximately 10 to the minus 8th power mm/cycle). In this second annual report, the status of the program is described in terms of i) an expanded review of the factors which lead to differences in long and short crack behavior, with particular regard to the role of crack closure mechanisms, ii) a description of experiments performed to characterize the role of microstructure in influencing the propagation of long cracks in I/M 7150 aluminum alloys, and iii) a description of experiments carried out to isolate the effects of crack closure on the propagation of both long and short cracks, and specifically to investigate the location of the closure responsible for the development

ABSTRACT: (U) The differential equations for the
evolution of the fluid quantities in steady detonation
waves are integrated numerically using a fourth order
Runge-Kutta-Fehlberg method. Strong and weak detonation
waves are found as well as detonation failure. In the
weak regime there is a continuum of propagation speeds
for a given expansion loss.

UNCLASSIFIED REPORT

ABSTRACT: (U) Progress was made in three related areas: vision, movement, and rhythm. A realtime processing theory was introduced of how the visual system discounts several types of noise in visual data, yet rapidly generates global visual representations. These mechanisms can be interpreted both behaviorally and neurally. The mechanisms describe new parallel processing algorithms that operate within hierarchical networks. Simulations were made of real and illusory contour formation, neon color spreading, complementary color induction, and filling-in. The theory physically interprets and generalizes Land's retinex theory of color vision, and unifies the explanation of monocular and binocular brightness data. The simulated data include Craik-O'Brien demonstrations comparing brightness of smoothly modulated and step-like luminance profiles; nonclassical differences between the perception of luminance decrements and increments; Fechner's paradox, binocular brightness averaging, and binocular brightness summation; binocular rivalry; and fading of stabilized images and ganzfelds. Two parallel contour processes interact to generate the theory's brightness, color, and form explanations.

ABSTRACT: (U) The initiation of a carcinogenic insult
appears to be optimally effective when the cells are
insulted in early S phase of the cell cycle. The
transformed phenotype has sarcoma associated determinants
that are similar to the ectopic determinants found on
human sarcoma-tumor tissue. Both these cell types, i.e.
chemically transformed human fibroblasts and sarcoma
tumor cells, exhibit cellular invasiveness, neoplastic
potential and finite but extended lifespan in vitro.
Using selection pressures for culturing of human normal
cells in culture followed by insulting the DNA we can
isolate cells from the transformed phenotype, from cells
that will respond to the insult as a toxic insult. The
carcinogen-specific DNA adducts formed under these
conditions are qualitatively and quantitatively similar.

ABSTRACT: (U) Laboratory experiments show that when
small ice particles collide with targets at speeds of up
to 80m/s then the charge transfer is dependent upon the
work function of the target material. Most common
materials charge negatively, in agreement with observed
aircraft charging in ice clouds, but magnesium which has
a low work function charges positively. These results
enable the charging of materials to be predicted before
flight, and also suggest that alloys of magnesium should
minimise aircraft charging. The laboratory apparatus
could be used to characterize the charging of the new
composite materials for aircraft surfaces.

ABSTRACT: (U) The objective of this research was to define the chemical factors that affect onset of superconductivity in ternary compounds: to determine how small changes in stoichiometry and microstructure influence critical temperature, how the number and placing of magnetic ions act to quench superconductivity, and how the crystal structure can be modified to enhance superconductivity. The approach was to synthesize, from ultrapure starting elements, ternary borides, silicides, sulfides and selenides of the second and third row transition elements, to characterize the new compounds for x-ray structure, electric and magnetic behavior, and then compare them with doped materials. Four kinds of compounds were investigated: rare earth diosmium disilicides, rare earth osmium-iridium borides, layered structure transition metal dichalcogenides, and Chevrel type molybdenum ternaries. Both the rare earth osmium-iridium borides and rare earth diosmium disilicides were synthesized by arc melting. The crystal structures were refined and magnetic susceptibility studies revealed conventional Hund's rule behavior in the disilicides while the (Pr, Nd) (Os, Ir) 484 compounds are characterized by Van Vleck paramagnetism of closely spaced multiplets. Only LaOs2Si2 and LuOs2Si2 compounds are superconducting with Tc's in the 2-4K range. In the layered compounds, lithium intercalated ZrS2, ZrSe2, NbS2,

UNCLASSIFIED REPORT

ABSTRACT: (U) Characteristics of P-coda measurements at NORSAR were investigated for presumed underground nuclear explosions in the Soviet Union. For explosions in the Semipalatinsk region, coda magnitudes, measured in the time domain in 8-second windows averaged over 50 seconds of P coda, were found to vary by about 0.1 magnitude units across NORSAR as compared with about 0.2 to 0.3 units for P-wave magnitudes. Also, array-averaged estimates of coda magnitude varied more smoothly with time into the coda than single channel estimates. This result indicates that local subarray scattering causes random perturbations in coda levels which are smoothed out by the averaging process. NORSAR P-coda magnitudes, like the Lg measurements of Rindal (1983), are more consistent with network averaged P-wave magnitudes than NORSAR single-channel magnitudes. There is some indication that Lg measurements may be slightly better than P-coda measurements in terms of reducing scatter and bias. In the analysis of P-codas from seismic events north of the Caspian Sea, codas of presumed explosions in the Astrakhan region are more intense and variable as a function of time into the coda than those for events near Azgir. These differences are attributed to lateral variations in geologic structure in the Pri-Caspian salt basin.

ABSTRACT: (U) The syntheses for 1,1-(methyl-14C)-dimethylhydrazine, 1,2-(methyl-14C)-dimethylhydrazine, and the important metabolite of 1,2-dimethylhydrazine, namely, 14C-methylazoxymethanol as an acetate derivative are described. Materials for high specific activity were employed to (1) Investigate early events in carcinogenesis; (2) Study DNA modification and damage; and (3) Probe effects of anticarcinogen benzamide, on molecular perturbation of DNA by methylazoxymethanol acetate.

ABSTRACT: (U) The numerical and analytic solution of nonlinear singular systems of the form $Ax' + B(x) = f$ are studied. Numerical and analytic procedures are developed for several cases of interest. These results are applied to the analysis of semi-state circuit models, cheap control problems, and constrained path control problems. (Author)

SUPPLEMENTARY NOTE: Presented at the International Conference on Acoustics, Speech, and Signal Processing (1984).

ABSTRACT: (U) In recent years, tree-structured analysis/reconstruction systems have been extensively studied for use in subband coders for speech. In such systems, it is important that the individual channel signals be decimated in such a way that the number of samples coded and transmitted does not exceed the number of samples in the original speech signal. Under this constraint, the systems presented in the past have sought to remove the overall analysis/reconstruction distortion. In this paper, it is shown that it is possible to design tree-structured analysis/reconstruction systems which meet the sampling rate condition and which also result in exact reconstruction of the input signal. This paper develops the conditions for exact reconstruction and presents a general method for designing the corresponding high quality analysis and reconstruction filters. (Author)

ABSTRACT: (U) This paper addresses the problem of
segmenting an image by texture. Specifically, the
investigators are concerned with estimating the
trajectory of the boundary between the two regions
characterized by different two-dimensional
autocorrelation functions. An algorithm is developed
which is an approximation to a maximum-likelihood
estimator based on the assumption of Gaussian random
fields with known mean and covariance. Preliminary
experimental results are given. (Author)

UNCLASSIFIED REPORT

ABSTRACT: (U) During this grant period a substantial amount of previously begun work was completed and many papers have been published. A complete listing of publications is contained in the report. There was also a marked increase in general center activities, due to expansion of the faculty and some concomitant increase in short- and long-term visitors. The research concentrated on the following areas: linear systems over rings; control-theoretic problems by polynomial methods; realization of covariance sequences; and noisy modeling. (Author)

DESCRIPTORS: (U) *Mathematics, Theory, Reports, Linear systems, Rings(Mathematics), Control, Polynomials, Covariance

IDENTIFIERS: (U) PE81102F, WUAFOSR2304A8

UNCLASSIFIED REPORT

ABSTRACT: (U) This annual report briefly describes progress on research in non-linear control theory. Results reported include characterizations of the family of linearizations about constant operating points of non-linear systems described by transform-domain Volterra series, explicit formulas for the linearization of an interconnected system in terms of subsystem linearizations, and a characterization for linearization by feedback. Publications describing these results in detail are listed.

DESCRIPTORS: (U) *Control, Linearity, Theory, Nonlinear systems, Feedback, Reprints

UNCLASSIFIED REPORT

ABSTRACT: (U) Aimed at developing image processing methods for rock types analysis with LANDSAT data, numerous experiments were conducted using supervised and unsupervised classification techniques under the general concept of texture analysis with LANDSAT digital data covering two geological quads of Nevada. The results indicate that the supervised classification method is very effective in the extraction of granite regions when (1) data were in ratio format, (2) feature variables included both tone and texture information, and (3) the classifier is capable of handling non-normally distributed data. Classification errors occurred when there exists pixels of non-granite category whose spectral and textural properties are statistically similar to that of granite pixels. Two cases of errors can be noted: Type 1 pixels located at the periphery of the granite regions, and Type 2 pixels located far away from the core of the granite areas.

ABSTRACT: (U) The 1983 International Multigrid Conference was held at Colorado's Copper Mountain Ski Resort, April 5-8. It was organized jointly by the Institute for Computational Studies at Colorado State University, U.S.A., and the Gesellschaft fur Mathematik und Datenverarbeitung Bonn, F.R. Germany, and was sponsored by the Air Force Office of Sponsored Research and National Aeronautics and Space Administration Headquarters. The conference was attended by 80 scientists, divided by institution almost equally into private industry, research laboratories, and academia. Fifteen attendees came from countries other than the U.S. A. In addition to the fruitful discussions, the most significant factor of the conference was of course the lectures. The lecturers include most of the leaders in the field of multigrid research. The program offered a nice integrated blend of theory, numerical studies, basic research, and applications. Some of the new areas of research that have surfaced since the Kohn-Portz conference include: the 'algebraic multigrid approach; multigrid treatment of Euler equations for inviscid fluid flow problems; 3-D problems; and the application of MG methods on vector and parallel computers.

DESCRIPTORS: (U) *Information sciences, *Applied mathematics, Symposia, Research management, Algebraic functions, Approach, Differential equations, Inviscid flow, Three dimensional, Problem solving, Numerical

ABSTRACT: (U) This paper reports on a preliminary study of applying single-channel (scalar) and multichannel (vector) 2-D linear prediction to color image modeling and coding. Also, the novel idea of a multi-input single-output 2-D ADPCM coder is introduced. The results of this study indicate that texture information in multispectral images can be represented by linear prediction coefficients or matrices, whereas the prediction error conveys edge-information. Moreover, by using a single-channel edge-information the investigators obtained, from original color images of 24 bits/pixel, reconstructed images of good quality at information rates of 1 bit/pixel or less. UNCLASSIFIED REPORT

ABSTRACT: (U) This research program continued an
investigation of sensitivity analysis and its use in the
segmentation and identification of the phonetic units of
speech, that was initiated during the 1982 Summer Faculty
Research Program. The elements of the sensitivity matrix,
which express the relative change in each pole of the
speech model to a relative change in each coefficient of
the characteristic equation, were evaluated for an
expanded set of data which consisted of six vowels
contained in single words spoken in a simple carrier
phrase by five males with differing dialects. The
objectives were to evaluate the sensitivity matrix,
interpret its changes during the production of the vowels,
and to evaluate inter-speaker variations. It was
determined that the sensitivity analysis (1) serves to
segment the vowel interval, (2) provides a measure of
when a vowel is on target, and (3) should provide
sufficient information to identify each particular vowel.
Based on the results presented, sensitivity analysis
should result in more accurate segmentation and
identification of phonemes and should provide a
practicable framework for incorporation of acoustic-
phonetic variance as well as time and talker
normalization. (Author)

ABSTRACT: (U) This paper presents a general method for
the transformation of algorithms described by shift-
invariant fully-specified flow graphs into equivalent
systolic realization. The method consists of a set of
rules for the systematic manipulation of the flow graphs
into systolic form utilizing a set of theorems from graph
theory. It is shown that many of the previously published
systolic algorithms and many new algorithms can be
generated using this single procedure. (Author)

ABSTRACT: (U) This paper presents a preliminary study on
using Mathematical Morphology to represent and code a
binary or a grey-tone image by parts of its skeleton, a
thinned version of the image. An image can be uniquely
decomposed into skeleton, a thinned version of the image.
An image can be uniquely decomposed into skeleton
components, and then reconstructed by dilating these
components. Since, for a certain category of imagery, the
skeleton components possess a lower entropy than the
original image, a run-length or entropy coding scheme can
be used to achieve representation or transmission of the
image at a lower information rate than originally
required. (Author)

UNCLASSIFIED REPORT

ABSTRACT: (U) High energy laser systems with highly
accurate measurements as target tracking sensors use a
conical scan process to obtain a target capture and
tracking within the narrow beamwidth. This searching
process and the target tracking algorithm are major
factors in the performance of the laser radar/target
tracking system. Previous research results use
information-theoretic concepts in establishing a laser
radar/target tracking performance bound independent of
the filtering algorithm. A computer program was developed
to calculate the lower bound of the estimation error due
to the non-linear gaussian glint measurement process.
Applying the Extended Kalman filter to the angle
estimation problem for a gaussian glint measurement
process, the resulting filter is found to have a
structure consisting of a series of demodulations with
gains adaptively determined by the resulting angle
estimate. The optimal performance of this estimation
process is shown to be dependent on the angle and a bound
on the performance as well as a numerical algorithm is
presented. (Author)

UNCLASSIFIED REPORT

ABSTRACT: (U) A runtime monitoring system for detecting and describing tasking errors in Ada programs is presented. Basic concepts for classifying tasking errors called deadness errors, are defined. These concepts indicate which aspects of an Ada computation must be monitored in order to detect deadness errors resulting from attempts to rendezvous or terminate. They also provide a basis for the definition and proof of correct detection. Descriptions of deadness errors are given in terms of the basic concepts. The monitoring system has two parts: (1) a separately compiled runtime monitor that is added to any Ada source text to be monitored, and (2) a pre-processor that transforms the Ada source text so that necessary descriptive data is communicated to the monitor at runtime. Some basic preprocessing transformations and an abstract monitoring for a limited class of errors were previously presented.

ABSTRACT: (U) Research was carried out on the following
main topics: 1. Linear and Nonlinear Filtering and
related Scattering and Inverse Scattering Problems; and 2.
Stochastic Control with Partial Observations. Technical
details of the research may be found in the reports,
theses, and papers cited in the references. A list of
publications supported wholly or partially by this grant
is included at the end of this report.

UNCLASSIFIED REPORT

ABSTRACT: (U) This report describes work performed
during the second year of research on a Program Reference
Language. During this year, a study was conducted in
which protocols of programmers studying a new program
(with the intent of debugging it) were analyzed, both for
the vocabulary used and for indications of strategies
adopted in their efforts at program comprehension. A
sampling of programmers' natural vocabulary for
referencing programs was gathered and analyzed.
Preliminary steps were taken towards using this data as
the basis for the design of a formal query language for
the PRL. The study also raised some new issues bearing on
the implementation systems which use the PRL: individual
differences imply the need for customization; context-
sensitive information management is important; and useful
user interface features were identified (Author)

ABSTRACT: (U) Five papers have been prepared under this
contract in which recently developed differential phase
statistics have been successfully employed to obtain
error rate performance of differential modulation systems
operating under practical conditions. These practical
conditions included power imbalance, phase-change offset,
noise correlations and intersymbol interference. The
modulation systems considered were binary conventional
and symmetric DPSK, offset DPSK, and M-ary DPSK. The
channels studied were both terrestrial and satellite.
Closed form expressions, requiring some numerical
integration, were obtained in all cases. Extensive
performance curves showing the effects of the various
impairments were presented. Because satellite link
performance depends strongly upon the qualities of the
uplink, as shown, it was concluded that a satellite
repeater is much less effective than a detect and
remodulate transponder in a severe jamming environment.
Asymptotic approximations to M-ary DPSK were shown to
be extremely good, and it was suggested that more emphasis
be placed on such methods as opposed to the more
traditional, but much less accurate, use of bounds.

ABSTRACT: (U) Many techniques are available for the estimation of the power spectrum of a stationary random process. While power spectrum estimation is a problem which falls within the domain of signal processing, the problem of inferring information falls within the domain of artificial intelligence (AI). With a wide variety of different types of power spectrum estimation techniques to choose from, an equally wide range of differing spectral estimates may be produced. Each estimate, however, may be used to infer information about the time series. By defining an appropriate knowledge base, a system is being developed to infer information from power spectrum estimates. This system combines the estimates produced by a variety of current spectrum estimation techniques in order to formulate a composite spectral estimate. (Author)

UNCLASSIFIED REPORT

ABSTRACT: (U) This paper introduces a new iterative image restoration method which is capable of restoring noisy, blurred images by incorporating a priori knowledge about the image and noise statistics into the iterative procedure. The iteration equation consists of a prediction part which is based on a noncausal image model description and an innovation part which is weighted by a gain factor. The gain is computed using a linear MSE optimization procedure and is updated at each step of the iteration. This image restoration scheme can be interpreted as an iterative procedure with a statistical constraint on the image data.

ABSTRACT: The report summarizes progress in research supported by the grant during this period in the following areas: (1) stochastic control under partial observations; (2) nonlinear filtering; (3) large deviations for nearly deterministic processes; and (4) transition and invariant densities for nearly deterministic diffusions. A list of papers resulting from the research effort is included. (Author)

ABSTRACT: (U) Two passages, each consisting of a 19 and 19 sentence version, were constructed from the same passage on the development of the atom bomb. The passage sentences are individually typed on index cards. The four resulting bundles were then scrambled. Subjects were undergraduate psychology students at the University of Colorado who received one of the four scrambled bundles. Sentences: Subjects were asked to reconstruct the original passage using a slotted board. In the feedback condition, subjects were given five tokens to indicate if a card had been appropriately placed. The post-feedback students received any appropriate information regarding the correct placement. In both conditions subjects signalled when they thought they were through. The dependent measures were time (in minutes), number of moves, percentage correct, the author's original order of sentences, percentage recall (the number of idea units recalled), and percentage recognition (choosing the original sentence from a pair containing a paraphrase). The recall and recognition measures were given directly after completion of the task. The independent variables were feedback, feedback, content, and number of sentences.

ABSTRACT: (U) In this paper a class of iterative procedures is presented for reconstructing a finite duration sequence from noisy samples of its Fourier transform phase. These measurements are combined with a knowledge of the true transform magnitude and/or hard constraints on the phase noise variations to define sets whose intersection must contain the true sequence. The algorithms iterate between the known domain and the transform domain applying the known constraints (i.e., finite duration and known limits on phase variation) in each domain. Results of an experimental investigation are presented. A method is described for the case where limits on both the magnitude and phase variation of a finite length sequence are known. (Author)

ABSTRACT: (U) In a previous report the authors described the organization of an aerial image analysis system. There are three levels of representation and control in that system: A High Level Expert (HLE) that utilizes a symbolic hierarchical model for the possible spatial organization of objects in the image to build partial, local interpretations of the image and to determine where to further analyze the image and what analyses to perform, a Model Selection Expert that determines, on the basis of contextual information provided by the HLE, the most promising appearance descriptions to use in searching for objects and structures in the image; and a Low Level Vision Expert that finds pictorial entities that satisfy these appearance descriptions by selecting image processing methods to find the appropriate entities. Emphasis has been on the High Level Expert, which is based on a general method of 'evidence accumulation' to perform flexible spatial reasoning. This paper contains a detailed description of the evidence accumulation process and its associated consistency checking process.

ABSTRACT: (U) This annual report summarizes some preliminary results of a research effort directed towards the development of adaptive decentralized control systems. The adaptive controller in such a system must operate in the presence of unmodeled dynamics. An input-output approach is presented for analyzing the global stability and robustness properties of adaptive controllers under such circumstances. Conditions for guaranteeing global stability of the error system associated with the adaptive controller, and ensuring boundedness of the adaptive gains, are derived. Specific bounds are presented for certain signals in the control systems. (Author)

ABSTRACT: (U) This is a volume of contributed papers delivered at the International symposium on Gallium Arsenide and Related Compounds. The technical program of the conference included sessions on bulk and epitaxial crystal growth, optoelectronic devices, microwave devices, ion implantation, and characterization. Improvements in the preparation of high purity undoped semi-insulating GaAs were reported, along with considerable discussion of the EL2 electron trap in this material. Advances in bulk InP growth and the growth of bulk III-V alloys were presented. Research on GaAs, InP, and alloy high frequency and optoelectronic devices demonstrated increasingly sophisticated structures, including modulation-doped heterostructure charge-coupled devices.

ABSTRACT: (U) The International Conference on Immune Networks was held on 30 November - 1 December 1982. The discovery of idiotypes in humans by Dr. Kunkel and the discovery of idiotypes in the rabbit by Dr. Udén, as well as the formulation of the immune network concept by Dr. Jerne, has had a fundamental impact on the thinking of scientists interested in the area of the structure of immunoglobulin, the generation of antibody diversity, and the regulation of immune responses. The program of this meeting covered various aspects of the immune network with particular emphasis on the new theoretical developments in this concept. Also discussed was the idotype-determined regulation in various antigens, and parallel sets. The final session was devoted to the understanding of the mechanism responsible for the alteration in the communication between clones bound by idotype links in various diseases.

ABSTRACT: (U) A computer modeling study of pulsed H2+F2 and D2+F2 chemical lasers has been conducted. This work was directed toward understanding the role of kinetic rotational relaxation and vibrational-rotational relaxation mechanisms in HF and DF lasers. This study resulted in very comprehensive computer models that could predict spectral characteristics of pulsed laser performance using kinetics rate equation data and experimental conditions. In addition, experiments were conducted on a flash initiated pulsed H2+F2 laser facility to generate data to compare with the models developed in this study. Models were also developed that demonstrated the performance of pulsed laser driven amplifiers and optical resonance transfer lasers. Finally, simple models were constructed that permit efficient prediction of pulse energy and pulse power. (Author)

UNCLASSIFIED REPORT

ABSTRACT: (U) The main objective of the present investigation is to evaluate strain-softening formulations for contained fracture in cementitious materials such as concrete and geo-materials. This report includes two principal developments: a rational approach to identify softening properties due to tensile cracking and frictional slip from displacement controlled material testing, and a systematic verification of contained fracture computations from small-scale structural testing. To this end, a composite damage model is proposed to describe the degradation of strength and stiffness in the post-peak regime with the aid of a volume fraction formulation of localized damage within a finite element.

UNCLASSIFIED REPORT

ABSTRACT: (U) The performance of the new LSI simulator CLASSIE is evaluated on several circuits with a few hundred to over one thousand semiconductor devices. A more accurate run time prediction formula has been found to be appropriate for circuit simulators. The design decisions for optimal performance under the constraints of the hardware (CRAY-1) are presented. Vector computers have an increased potential for fast, accurate simulation at the transistor level of Large-Scale-Integrated Circuits. Design considerations for a new circuit simulator are developed based on the specifics of the vector computer architecture and of LSI circuits. The simulation of Large-Scale-Integrated (LSI) circuits requires very long run time on conventional circuit analysis programs such as SPICE2 and super-mini computers. A new simulator for LSI circuits, CLASSIE, which takes advantage of circuit hierarchy and repetitiveness, and array processors capable of high-speed floating-point computation are a promising combination. While a large number of powerful design verification tools have been developed for IC design at the transistor and logic gate levels, there are very few silicon-oriented tools for architectural design and evaluation.

ABSTRACT: (U) Three major efforts in organosilicon chemistry were initiated during the tenure of this grant: 1) synthetic organosilicon electro-chemistry; 2)

synthetic applications of Lewis Acid catalyzed redistribution reaction; and, 3) synthetic applications of ultrasonic waves. All three projects were successful to varying degrees. In electrochemistry, the first electrochemical characterizations of functionalized organosilanes was carried out and will be submitted for publication during 1984. Additionally, the first syntheses of a variety of disilanes from chlorosilanes under controlled potential conditions was affected. The redistribution reaction was successfully applied to prepare cyclic and caged silanes. A wide variety of cyclics were synthesized in good yield. Ultrasonic irradiation of heterogeneous reactions was found to greatly accelerate reaction rates giving a narrow distribution of products in high yields. Improved yields under milder conditions for many reactions were observed. (Author)

UNCLASSIFIED REPORT

ABSTRACT: (U) The influence of stator row geometry modification on the aerodynamic performance of a two-stage, low-speed, axial-flow research compressor was assessed in the experiments described in this project. Stator geometry modifications tested included stator leading edge forward symmetrical sweep, large-radius blade/annulus wall corner fillets, and stator hub gap sealing (shrouding). Comparisons were made between detailed aerodynamic data associated with baseline and modified configurations. Substantial stator exit flow-field changes attributable to symmetrical sweeping of stator leading edges and to hub clearance sealing were observed with some evidence of corresponding near end wall loss reduction. The effects of large radii filleting were less clear. Interesting conclusions about the off-design flow rate performance of the compressor also resulted from consideration of experimental data. UNCLASSIFIED REPORT

ABSTRACT: (U) The major objective was to directly observe the formation and/or propagation of microcracks in concrete (plain and reinforced) both before and after applications of axial, biaxial, and dynamic stress fields. As part of this objective, procedures, techniques, apparatus, and equipment were developed and/or modified for the study of concrete fracture utilizing the Scanning Electron Microscope (SEM). In addition, information regarding microcracks, propagation of these microcracks (concrete failure), aggregate shape, plain and reinforced concrete, the sum effect of various stress fields, and the ultimate strength of concrete was found. Information regarding microcracks, aggregate shape, plain and reinforced concrete, the sum effects of various stress fields, and the ultimate strength of concrete was found for concrete containing blended cements. Concrete may fail from applied service loads or applied stress fields whether they are axial, biaxial, or dynamic. Also, concrete may fail as a result of volume changes such as the hydration of the cement paste leading to the shrinkage microcracks or to various cycles of wetting and drying or temperature variations (freezing and thawing). Thus, a model previously developed was investigated and the equations developed were found to be appropriate.

DESCRIPTORS: U *Concrete. *Failure. *Electron microscopes. *Electronic scanners. Microcracking.

UNCLASSIFIED REPORT

ABSTRACT: (U) Ferroelectric tungsten bronze single crystals were grown by the Czochralski technique. The crystals belong to the tetragonal point group 4mm with spontaneous polarization parallel to the 'c' axis. Room temperature dielectric and piezoelectric measurements indicated that the k 15 and d 15 coefficients are significantly larger for these bigger unit cell bronzes as compared to the smaller unit cell bronzes, e.g. SBN, SKN, etc. The results of this study indicated that since the piezoelectric properties of these crystals are better than SBN, it is expected that these composition crystals should show better acoustical properties. As reported earlier, SBN crystals are known to possess excellent acoustical properties and are useful for device application. Hence, this opens up further new interest in this family of crystals for potential use in SAW device applications. (Author)

UNCLASSIFIED REPORT

ABSTRACT: (U) The objectives of this study were to model the surface heating of asphaltic concrete pavements and to investigate the thermal properties (conductivity, specific heat, and diffusivity) of asphaltic concrete. The thermal properties of six laboratory prepared asphaltic concrete mixes at three asphalt contents were determined. As a result of testing four or five replicate samples of each of the eighteen mix combinations, it was concluded that average values of specific heat and diffusivity, independent of asphalt content but dependent on aggregate gradation and mineralogy, could be used. Conductivity varied with asphalt content as well as aggregate type and gradation. A parameter study using the transient heat transfer model which employed radiant and convection heating of the pavement surface and conduction through the asphaltic concrete indicated that: without exceeding the flash point of asphaltic concrete, it typically takes a field heater 25-35 minutes to heat the pavement at a depth of 25 mm to a temperature sufficient for easy removal (this was verified by field test); combined convection-thermal radiation heating is more efficient than radiant heating, and; the best surface heating strategy is to operate the heater at a temperature such that the pavement reaches its maximum allowable temperature just as the desired temperature is reached at the prescribed removal depth without using insulation periods (soaking) between heat applications.

Symposium on the Qinghai-Xizang (Tibet) Plateau and
Mountain Meteorology, 20-24 Mar 84, China. Sponsored in
part by Grants NAGW-601.

ABSTRACT: (U) Motion systems of various scales are
caused by the differential heating of plateaus and the
surrounding plains. On the largest scales, monsoonal
systems and their interannual variability are considered.
Comparisons are made between the effects of the Western
Plateau of North America and the Plateau of Tibet.
Synoptic-scale systems are strongly affected by the
plateaus of the northern hemisphere. An example of
cyclogenesis over Eastern Tibet is given through a
numerical experiment. During heating effects of the
Western Plateau of North America cause a large-scale
plateau circulation system to develop. This system has a
decisive impact on the diurnal variability of
thunderstorm activity over the plateaus and over the
plains to the east. It is shown that local heating and
cooling by detailed topographic features can interact
with the diurnal plateau circulation system.

UNCLASSIFIED REPORT

ABSTRACT: (U) The recent measurements and study of the carbon-induced localized vibrational mode (LVM) in GaAs have demonstrated that nearest neighbor isotropic frequency shifts can be observed if one uses the high resolution capability of a Fourier transform infrared (FTIR) spectrometer. One major importance of such measurements lies in the use of the shifts to determine the impurity site and the formation of complexes such as dimers. This feature has been used in a detailed study of the LVM infrared absorption of Si-doped GaAs. Samples electrically compensated by electron irradiation and by Li saturation were used in the study. Bands due to SiGa, SiAs, SiGa-SiAs, 7LiGa, and SiAs-AsGa (or VGa) were studied in high resolution. In several cases the structures observed in the high resolution measurements were compared with model calculations with generally satisfactory results.

ABSTRACT: (U) A description of the test apparatus and some major experimental results are presented. The test apparatus is a pressurized test cell for simulation of translational motion by pressurization of the inlet flow to the corresponding stagnation pressure. The experiment consisted of measurement of the pressure distribution along the ejector surfaces and of the pressure, temperature and forces required to evaluate the mass flow, total forces and the ram drag. In addition, Schlieren photographs were taken at each test to observe the flow and in particular to illustrate the shock wave patterns. Combination of the pressure distribution and Schlieren photographs illustrate the successful achievement of second solution flows. Further tests are to be performed to illustrate the optimization of second solution performance and for comparison between theory and experiment. (Author)

ABSTRACT: (U) The investigators suggest a new approach to database updates, in which a database is treated as a collection of theories. They investigate two issues: 1) equivalence of databases under update operations, b) simultaneous multiple update operations. (Author)

ABSTRACT: (U) During the period of the grant the investigators continued their studies of one-four dimensional classical and quantum lattice and continuous completely integrable systems. Their technique is based on the method of Backlund transformations and their algebraic, geometric and arithmetic properties. Methods of Backlund transformations were successfully used in the study of Pade approximations. One of the significant achievements during the last year was the solution of the key problem on the almost perfectness of Pade approximations to solutions of linear differential equations. (Author)

UNCLASSIFIED REPORT

ABSTRACT: (U) The automatic nervous system is made up of two subsystems: the parasympathetic (PNS) and the sympathetic (SNS). The balance between these systems regulates bodily functioning during routine (PNS-dominant) and crisis (SNS-dominant) situations. It also controls visual accommodation for near (PNS-dominant) and far (SNS-dominant) focus. The balance between these physiological systems has been linked to individual differences in personality characteristics, especially introversion (PNS-dominant) and extraversion (SNS-dominant). Since the balance mediates accommodation, the similar personality differences between near- and far-sighted individuals may be related to the more general parasympathetic-sympathetic balance rather than being related solely to the visual capability difference. The relationships among autonomic balance (as measured by a battery of four physiological tests modified from Wenger and Ellington, 1943, and by a technique introduced by Porges, 1976), refractive error (measured by dark focus, near and far points using a polarized vernier optometer), and introversion - extraversion (Eysenck Personality Inventory introversion - extraversion scale core) were investigated.

ABSTRACT: (U) It is known that under a wide variety of assumptions a database decomposition is lossless if and only if the database scheme has a lossless join. Biskup, Dayal, and Bernstein have shown that when the given dependencies are functional then the database scheme has a lossless join if and only if one of the relation scheme is a key for the universal scheme. In this note the investigators supply an alternative proof of that characterization. The proof uses tools from the theory of embedded join dependencies and the theory of tuple and equality generating dependencies, but is, nevertheless, much simpler than the previously published proof.
